

# Status of MUonE and RadioMonteCarLow (+ Strong2020) activities

G. Venanzoni,  
INFN-Pisa  
on behalf of many colleagues

“The closer you look the more there is to see” (F. Jegerlehner)

# Simon

We will deeply miss him

# Muon g-2: present status

- HVP is the main limitation to the improvement in precision to the SM evaluation  $a_{\mu}$
- Recent evaluation(s) of HVP from lattice (BMW20) in tension with the  $e^+e^-$  evaluation (WP20)

# A «Third way»: MUonE at CERN

(a space-like approach of  $a_\mu^{HLO}$ )

$$a_\mu^{HLO} = \frac{\alpha_0}{\pi} \int_0^1 dx (1-x) \Delta\alpha_{had}[t(x)]$$

$$t(x) = \frac{x^2 m_\mu^2}{x-1} < 0$$

Measurement of  $\Delta\alpha_{had}(t)$ : hadronic contribution to the running of the electromagnetic coupling constant.

- C. M. Carloni Calame et al *PLB* 746 (2015) 325
- G. Abbiendi et al *Eur.Phys.J.C* 77 (2017) 3, 139

# The MUonE experiment

Extraction of  $\Delta\alpha_{had}(t)$  from the «shape» of the  $\mu^+ e^- \rightarrow \mu^+ e^-$  elastic differential cross section

$$\frac{d\sigma_{data}/dt}{\underbrace{d\sigma_{MC}^{no VP}/dt}_{\text{From theoretical calculation}}} = \frac{1}{\underbrace{|1 - \Delta\alpha_{lep}(t) - \Delta\alpha_{had}(t)|^2}_{\text{To be measured}}}$$

- A beam of 160 GeV muons allows to cover the whole  $q_{\mu}^{HLO}$ .
- Correlation between muon and electron angles allows to select elastic events and reject background ( $e^+e^-$  pair production).
- Boosted kinematics:  
 $\theta_{\mu} < 5$  mrad,  $\theta_e < 32$  mrad.

# The experimental apparatus

× 40

Beryllium target 1.5 cm thickness

Tracking system: 3 pairs of silicon strip detectors

# Achievable accuracy

40 stations + 3 years of data taking  
( $I_\mu \sim 10^7 \mu/s$ )

0.3% statistical accuracy on  $a_\mu^{HLO}$

Competitive with the time-like accuracy.

The big challenge of the experiment is to reach a comparable systematic accuracy

Systematic uncertainty of 10 ppm at the peak of the integrand function

- Longitudinal alignment ( $\sim 10 \mu\text{m}$ )
- Knowledge of the beam energy (few MeV)
- Multiple scattering ( $\sim 1\%$ )

# Last years progress

1. Multiple scattering studies (TB 2017)
2. Test beam at  $\mu$  beamline (M2) at CERN in 2018
3. Baseline choice of Si detectors (CMS)
4. MC NLO studies
5. Lol at SPSC
6. Test RUN approved for 2021 ( $\rightarrow$  2022)
7. Theory progress towards NNLO MC

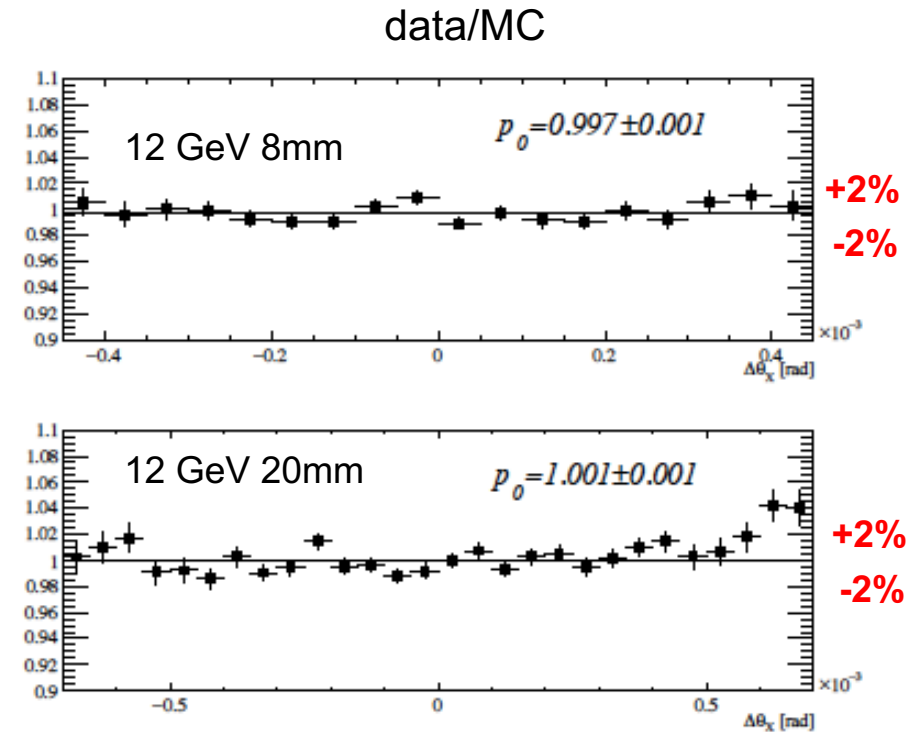

-Lol <https://cds.cern.ch/record/2677471/files/SPSC-I-252.pdf>

# Results on Multiple Coulomb Scattering from 12 and 20 GeV electrons on Carbon targets (8, 20 mm)

# Test beam at M2 in 2018

*G. Abbiendi et al JINST 16 (2021) 06, P06005*

# Tracking system: CMS 2S Module (baseline choice)

## Requirements:

- Good resolution ( $\sim 20 \mu\text{m}$ )
- High uniformity ( $\epsilon \gtrsim 99.99\%$ )
- Capable to sustain high rate (50 MHz)
- Available technology (test run 2021)

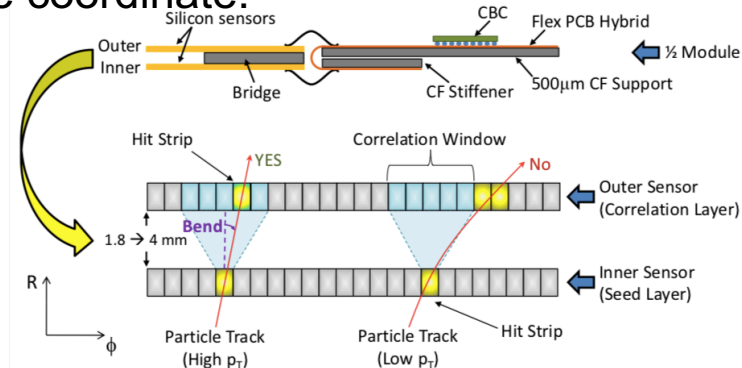

## Achievement: CMS 2S Module

- Thickness :  $2 \times 320 \mu\text{m}$
- Pitch:  $90 \mu\text{m} \rightarrow \sigma_x = 26 \mu\text{m}$
- Angular resolution:  $\sigma_\theta \sim 30 \mu\text{rad}$
- Readout rate: 40 MHz
- Area:  $10 \text{ cm} \times 10 \text{ cm}$
- Efficiency =  $99.988 \pm 0.008$

Provide complete and uniform angular acceptance, background suppression from single-sensor hits and rejection of large angle tracks.

Stub: Two close-by strip sensors reading the same coordinate.

# Tracker: CMS 2S modules readiness

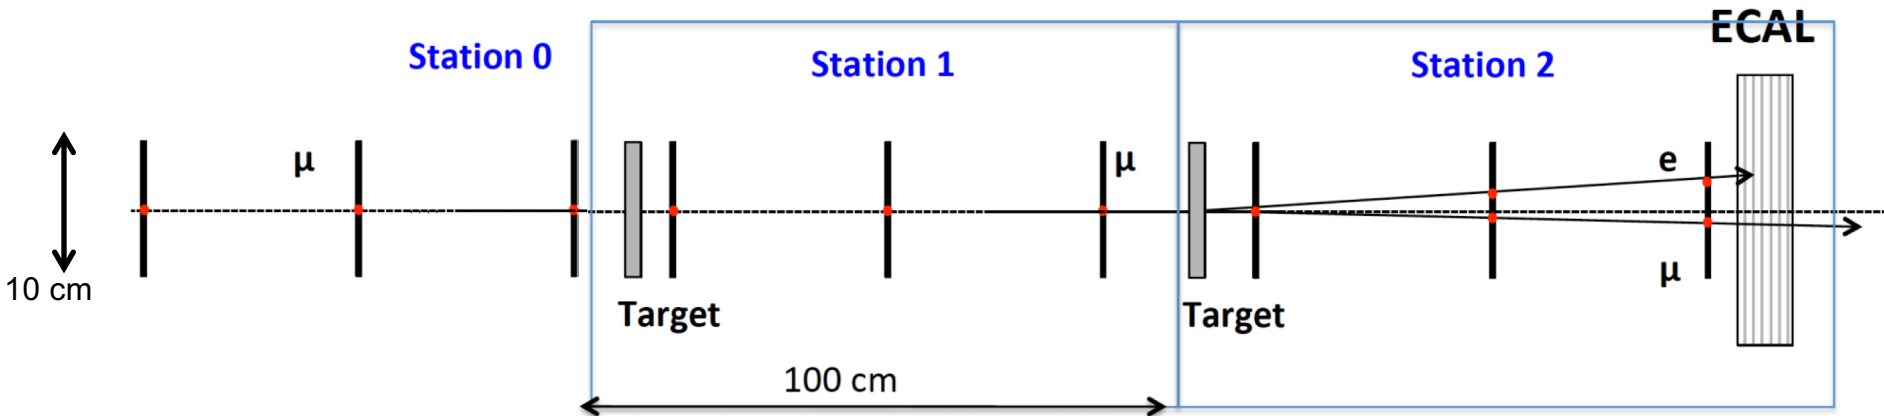

- Two dummy 2S modules have been assembled in Perugia.
- Assembly procedure is well defined, metrology measurements meet the CMS quality requirements.
- Ready to build functional 2S modules, as soon as components will be made available by CMS.

# Test Run 2021 setup

A Test Run with a reduced detector has been approved by SPSC, to validate our proposal.

## Main goals:

- Pretracker +
- 2 MUonE stations +
- ECAL
- Confirm the system engineering.
- Monitor mechanical and thermal stability.
- Check the DAQ system.
- Extract  $\Delta\alpha_{lep}(t)$ .

# Location: M2 beam line at CERN

## Beam momentum

## Beam spot: $\sigma_x \sim \sigma_y \sim 2.7 \text{ cm}$

- Location: upstream the COMPASS detector (CERN North Area).
- Low divergence muon beam:  $\sigma_x \sim \sigma_y \sim 0.3 \text{ mrad}$ .
- Spill duration  $\sim 5 \text{ s}$ . Duty cycle  $\sim 25\%$ .
- Maximum rate:  $50 \text{ MHz}$  ( $\sim 3 \times 10^8 \mu^+/\text{spill}$ ).

# Tracking station

Relative position within a station must be stable at  $10\ \mu\text{m}$ .

Low CTE mechanical structure: INVAR (alloy of 65%Fe, 35%Ni).

- (x, y) layers tilted by  $233\ \text{mrad}$ , to improve single hit resolution.
  - Simulation studies show a resolution of  $\sim 10\ \mu\text{m}$ .
- (u, v) layers to solve reconstruction ambiguities.

Tilted  
(x, y) layers

# Tracking station

# Tracking station

Aluminum mockup ready.

Stepper motors will be used to align the station to the beam.

They have been installed and successfully tested in Pisa.

- 5x5 PbWO<sub>4</sub> crystals (CMS ECAL).
  - 2.85x2.85 cm<sup>2</sup>.
  - Length: 22cm (~25 X<sub>0</sub>).
- Total area: ~14x14 cm<sup>2</sup>.
- Readout: APD sensors, 10x10mm<sup>2</sup> photosensitive area.

Mechanics and crystal tests currently ongoing in Padova.

# DAQ system

- Test Run: read all data with no event selection.
- Information will be used to determine online selection algorithms to be used in the Full Run.

# Extraction of $a_\mu^{HLO}$

$\Delta\alpha_{had}(t)$  parameterised according to the “Lepton-Like” form.

$$\Delta\alpha_{had}(t) = KM \left\{ -\frac{5}{9} - \frac{4M}{3t} + \left( \frac{4M^2}{3t^2} + \frac{M}{3t} - \frac{1}{6} \right) \frac{2}{\sqrt{1 - \frac{4M}{t}}} \ln \left| \frac{1 - \sqrt{1 - \frac{4M}{t}}}{1 + \sqrt{1 - \frac{4M}{t}}} \right| \right\} \quad \begin{array}{l} \text{2-parameters} \\ \text{function (K, M)} \end{array}$$

Template fit to the 2D  $(\theta_e, \theta_\mu)$  angular distribution from NLO MC generator with parameterised detector resolution  $\rightarrow \Delta\alpha_{had}(t)$  best fit

$$a_\mu^{HLO} = \frac{\alpha_0}{\pi} \int_0^1 dx (1-x) \Delta\alpha_{had}[t(x)]$$

From  $\Delta\alpha_{had}(t)$  best fit  $\rightarrow a_\mu^{HLO}$  in the whole range

$a_\mu^{HLO}$  (MUonE) =  $(688.8 \pm 2.4) \times 10^{-10}$  vs  $688.6 \times 10^{-10}$  (input value)  
[full statistics,  $1.5 \times 10^4 \text{ pb}^{-1}$  ( $4 \times 10^{12}$  evts with  $E_e > 1 \text{ GeV}$ )]

# Sensitivity to $\Delta\alpha_{had}(t)$ Test RUN

Expected luminosity for the Test Run:  $L = 5 \text{ pb}^{-1} \sim 10^9$  events with  $E_e > 1 \text{ GeV}$   
 $(\theta_e < 30 \text{ mrad})$

We will be able to extract the leptonic running ( $\Delta\alpha_{lep} \sim 10^{-2}$ )

Marginal sensitivity also to the hadronic running ( $\Delta\alpha_{had} \sim 10^{-3}$ )

$$K = 0.137 \pm 0.027$$

$$\Delta\alpha_{had}(t) \simeq -\frac{1}{15} K t$$

Template fit with just one fit parameter  $K = k/M$  in the  $\Delta\alpha_{had}$  parameterization. The other parameter fixed at its expected value:  $M = 0.0525 \text{ GeV}^2$

# Theory

# Conclusions (MUonE)

- The new method proposed by MUonE to determine  $a_{\mu}^{HLO}$  is independent and competitive ( $\sim 0.3\%$  stat error) with the latest evaluations.
- A Test Run of 3 weeks is foreseen at CERN in Fall 2021-early 2022. The aim of the Test Run will be to verify the detector design and evaluate the analysis strategy.
- If the Test Run will confirm the goodness of our proposal, a Run with the full detector is envisaged in 2022-24.

# Working Group on Rad. Corrections and MC Generators for Low Energies

- Meetings with theorists and experimentalists sitting together.
- An informal room and a valuable platform to exchange ideas, enriched of new subjects (and people) during the years
- First meeting in Oct 2006. 20 meetings since then. More than 60 participants from more than 10 different countries
- 2 WG coordinators (H. Czyz, G. Venanzoni)
- 7 Subgroups
- A first report in 2010. Maybe an update is needed?

# Working Group on Rad. Corrections and MC Generators for Low Energies

The aim of this Working Group is to bring together theorists and experimentalists in order to discuss the current status of radiative corrections and Monte Carlo generators at low energies. These radiative corrections and MC generators are crucial for the measurement of the R-ratio (both with ISR and energy scan), as well as the determination of luminosity.

The [twentieth meeting](#) took place at the Budker Institute of Nuclear Physics in Novosibirsk on Saturday March 2 2019 as satellite of the [PHIPSI19](#) Workshop.

The [nineteenth meeting](#) took place in Mainz in the [Institute for Nuclear Physics of Mainz](#) on Friday 30 June 2017 as satellite of the [PHIPSI17](#) Workshop.

The [eighteenth meeting](#) took place in Frascati, on May 19/20 2016.

The [seventeenth meeting](#) took place in Frascati, on April 20/21 2015.

The [sixteenth meeting](#) took place in Frascati, on November 18/19 2014.

The [fifteenth meeting](#) took place in Mainz, on April 11 2014.

The [fourteenth meeting](#) took place in Frascati, on September 13 2013, as a satellite meeting of the [PHIPSI13](#) conference in Rome.

# The Subjects covered:

- Monte Carlo generators for Luminosity
- Monte Carlo generators for  $e^+e^-$  into hadrons and leptons
- Monte Carlo generators for  $e^+e^-$  into hadrons and leptons plus photon (ISR)
- Monte Carlo generators for  $\tau$  production and decays
- Hadronic Vacuum Polarization,  $\Delta\alpha_{em}(Z0)$  and  $(g-2)_\mu$
- Gamma-gamma physics
- FSR models and Transition Form Factors

Each of them has 2 convenors

# Radiative Corrections for ISR

## Radiator-Function $H(s, s_p)$ (ISR):

- ISR-Process calculated at NLO-level

*PHOKHARA* generator

(H.Czyż, A.Grzelińska, J.H.Kühn, G.Rodrigo, EPJC27,2003)

Precision: 0.5%

$$s \cdot \frac{d\sigma_{\pi\pi\gamma}}{ds_\pi} = \sigma_{\pi\pi}(s_\pi) \times H(s, s_\pi)$$

## Radiative Corrections:

### i) Bare Cross Section

divide by Vacuum Polarisation  $d(s)=(a(s)/a(0))^2$

→ from F. Jegerlehner

### ii) FSR

Cross section  $s_{pp}$  must be incl. for FSR

for use in the dispersion integral of  $a_m$

FSR corrections have to be taken into account in the efficiency eval. (Acceptance,  $M_{Trk}$ ) and in the mapping  $s_\pi \rightarrow s_{\gamma^*}$

(H.Czyż, A.Grzelińska, J.H.Kühn, G.Rodrigo, EPJC33,2004)

$$s_{\gamma^*} > s_p$$

# Radiative corrections for energy scan:

All modes except  $2\pi$

$$\sigma(e^+e^- \rightarrow H) = \frac{N_H - N_{bg}}{L \cdot \varepsilon \cdot (1 + \delta)}$$

- Luminosity  $L$  is measured using Bhabha scattering at large angles
- Efficiency  $\varepsilon$  is calculated via Monte Carlo + corrections for imperfect detector
- Radiative correction  $\delta$  accounts for ISR effects only

$2\pi$

$$|F_\pi|^2 = \frac{N_{2\pi}}{N_{ee}} \cdot \frac{\sigma_{ee} \cdot (1 + \delta_{ee})}{\sigma_{2\pi}(\text{point-like } \pi) \cdot (1 + \delta_{2\pi})}$$

- Ratio  $N(2\pi)/N(ee)$  is measured directly  $\Rightarrow$  **detector inefficiencies are cancelled out**
- Virtually no background
- Analysis does not rely on simulation
- Radiative corrections account for ISR and FSR effects
- **Formfactor is measured to better precision than  $L$**

**Abstract** We present the achievements of the last years of the experimental and theoretical groups working on hadronic cross section measurements at the low-energy  $e^+e^-$  colliders in Beijing, Frascati, Ithaca, Novosibirsk, Stanford and Tsukuba and on  $\tau$  decays. We sketch the prospects in these fields for the years to come. We emphasise the status and the precision of the Monte Carlo generators used to analyse the hadronic cross section measurements obtained as well with energy scans as with radiative return, to determine luminosities and  $\tau$  decays. The radiative corrections fully or approximately implemented in the various codes and the contribution of the vacuum polarisation are discussed.

## 1 Introduction

The systematic comparison of Standard Model (SM) predictions with precise experimental data served in the last decades as an invaluable tool to test the theory at the quantum level. It has also provided stringent constraints on “new physics” scenarios. The (so far) remarkable agreement between the measurements of the electroweak observables and their SM predictions is a striking experimental confirmation of the theory, even if there are a few observables where the agreement is not so satisfactory. On the other hand, the Higgs boson has not yet been observed, and there are clear phenomenological facts (dark matter, matter-antimatter asymmetry in the universe) as well as strong theoretical arguments hinting at the presence of physics beyond

## “Tuned” comparisons are essential!

Theoretical accuracies of these generators were estimated, whenever possible, by evaluating missing higher-order contributions. From this point of view, the great progress in the calculation of two-loop corrections to the Bhabha scattering cross section was essential to establish the high theoretical accuracy of the existing generators for the luminosity measurement. However, usually only analytical or semi-analytical estimates of missing terms exist which don't take into account realistic experimental cuts. In addition, MC event generators include different parameterisations for the VP which affect the prediction (and the precision) of the cross sections and also the RC are usually implemented differently.

Example:

# BabaYaga and its theoretical accuracy

Carlo M. Carloni Calame

INFN, Sezione di Pavia

Working Group on Radiative corrections and generators for low energy hadronic cross section and luminosity

# Cuts dependence study for different experiments

## 1. $\Phi$ factories KLOE/DAΦNE (Frascati)

- (a)  $\sqrt{s} = 1.02$  GeV
- (b)  $E_{min} = 0.4$  GeV
- (c) For  $\theta_{\pm}$  two selections have to be checked
  - i. tighter selection  $55^{\circ} < \theta_{\pm} < 125^{\circ}$
  - ii. wider selection  $20^{\circ} < \theta_{\pm} < 160^{\circ}$
- (d)  $\zeta_{max} = 4, 5, 6, 7, 8, \dots, 14^{\circ}$ , with reference value  $\zeta_{max} = 9^{\circ}$

## 2. B-factories BABAR/PEP-II (SLAC) & BELLE/KEKB (KEK)

- (a)  $\sqrt{s} = 10.56$  GeV
- (b)  $|\vec{p}_{+}|/E_{beam} > 0.75$  and  $|\vec{p}_{-}|/E_{beam} > 0.50$   
or  $|\vec{p}_{-}|/E_{beam} > 0.75$  and  $|\vec{p}_{+}|/E_{beam} > 0.50$
- (c) For  $|\cos(\theta_{\pm})|$  the following selections have to be checked
  - i.  $|\cos(\theta_{\pm})| < 0.65$  and  $|\cos(\theta_{+})| < 0.60$  or  $|\cos(\theta_{-})| < 0.60$
  - ii.  $|\cos(\theta_{\pm})| < 0.70$  and  $|\cos(\theta_{+})| < 0.65$  or  $|\cos(\theta_{-})| < 0.65$
  - iii.  $|\cos(\theta_{\pm})| < 0.60$  and  $|\cos(\theta_{+})| < 0.55$  or  $|\cos(\theta_{-})| < 0.55$
- (d)  $\zeta_{max}^{3d} = 20, 22, 24, \dots, 40^{\circ}$ , with reference value  $\zeta_{max}^{3d} = 30^{\circ}$

## Issues to be discussed here

Comparison of results with vacuum polarization obtained using :VPHLMNT (T.Teubner et all.) and hadr5n09 (F. Jegerlehner) (all results from BabaYaga) - all results in nb

**KLOE:**  $55^\circ < \theta \pm < 125^\circ$ ,  $\zeta_{max}=4^\circ$

$\sigma_{BY} = 436.85(5)$

vacpol	$\sigma_h$	$\sigma_{v+s}$	sum:
VPHLMNT(2009)	1.4346(5)	-1.126(2)	0.309(2)
hadr5n09	1.6264(6)	-1.405(2)	0.221(2)
relative difference: $\left  \frac{\sigma_{VPHLMNT}^{NNLO} - \sigma_{hadr5n09}^{NNLO}}{\sigma_{BY}} \right $			0.201(6)‰

**BES:**  $\sqrt{s} = 3.650$  GeV,  $|\cos \theta| < 0.8$

$\sigma_{BY} = 116.41(2)$  nb

vacpol	$\sigma_h$	$\sigma_{v+s}$	sum:
VPHLMNT2.0(2010)	1.6613(3)	-1.7860(2)	-0.1247(4)
hadr5n09	1.6471(7)	-1.7686(2)	-0.1215(7)
relative difference: $\left  \frac{\sigma_{VPHLMNT}^{NNLO} - \sigma_{hadr5n09}^{NNLO}}{\sigma_{BY}} \right $			0.0275‰

## Issues to be discussed here

**BES:**  $\sqrt{s} = 3.686 \text{ GeV}, |\cos\theta| < 0.8$   
 $\sigma_{BY} = 114.27(2) \text{ nb}$

vacpol	$\sigma_h$	$\sigma_{v+s}$	sum:
VPHLMNT2.0(2010)	10.006(4)	-16.80(1)	-6.79(1)
hadr5n09	9.60(1)	-16.28(2)	-6.68(3)
relative difference: $\left  \frac{\sigma_{VPHLMNT}^{NNLO} - \sigma_{hadr5n09}^{NNLO}}{\sigma_{BY}} \right $			0.96‰

**BES:**  $\sqrt{s} = 3.097 \text{ GeV}, |\cos\theta| < 0.9$   
 $\sigma_{BY} = 378.48(5) \text{ nb}$

vacpol	$\sigma_h$	$\sigma_{v+s}$	sum:
VPHLMNT2.0(2010)	-116.50(6)	287.7(3)	171.2(3)
hadr5n09	-119.1(2)	291.9(3)	172.8(4)
relative difference: $\left  \frac{\sigma_{VPHLMNT}^{NNLO} - \sigma_{hadr5n09}^{NNLO}}{\sigma_{BY}} \right $			4.227‰

## Systematic treatment of second order NLO QED radiative corrections to exclusive observables

Andrej Arbuzov

*Bogoliubov Laboratory of Theoretical Physics, Joint Institute for Nuclear  
Research, Dubna, Russia*

**Talk at the Radio Montecarlo workshop, Frascati,  
11th April 2008**

## Outlook

- ▶ The **ansatz** for the treatment of  $\mathcal{O}(\alpha^2 L^1)$  QED radiative corrections to exclusive observables is described
- ▶ The **ansatz** is suited for MC simulations
- ▶ Many processes can be treated in this way
- ▶  $\mathcal{O}(\alpha^2 L^0)$  contributions can be put into the same structure
- ▶ **MCGPJ** can be upgraded
- ▶ MC integrator and generator for Bhabha scattering is under development (upgrade of SAMBHA MC)

# Status of MC generators for radiative return

H. CZYŻ, IF, UŚ, Katowice      FRASCATI 2006

Motivation - what is the radiative return

What do we have on the market

Tests - comparisons, which were performed

My wish list

## S. Jadach, B. F. L. Ward and Z. Was

- ▶ YFS exponentiation
- ▶ high accuracy only for muon pairs
- ▶ can we hope for: upgrades ???  
broader collaboration ???

# PHOKHARA included in the game, $\mu$ -pairs again

PHOKHARA agrees to within 0.3% with KKMC and KKsem.

Discrepancy at high  $Q^2$  reflects lack of exponentiation in PHOKHARA

- ▶ benchmark for ISR NLO  
separately (?) for virtual and real corrections

- ▶ benchmark for ISR NNLO ???  
What accuracy do we need ?

- ▶ beyond ISR for muon and pion pairs:  
testing the codes **and** FSR models

- ▶ collect the results of separate code tests  
and comparisons

## “Non-Born”

$$M_{NB}^{\mu\nu}(Q, k, r) = -ie^2(\tau_1^{\mu\nu} f_1^{NB} + \tau_2^{\mu\nu} f_2^{NB} + \tau_3^{\mu\nu} f_3^{NB}),$$

- explicit form of  $f_{1,2,3}^{NB}$  is model-dependent

We now work with

- SU(2) and SU(3) Chiral Perturbation Theory
- KLOE model as implemented in PHOKHARA 6.1 and FASTERD by Olga Shekhovtsova [ Shekhovtsova, Venanzoni, Pancheri, arXiv:0901.4440 [hep-ph] (2009) ]

These models give “predictions” for FSR:  
parameters are fixed independently

## Role of “non-Born” correction

$$e^+e^- \rightarrow \pi^+\pi^-\gamma$$

$$\sqrt{s} = 1 \text{ GeV}$$

$$50^\circ < \theta_\gamma < 130^\circ$$

- model dependence is small
- at KLOE statistics the ChPT-corrections are not visible
- effect is enhanced at low  $m_{\pi\pi}$

# Going forward: Strong2020

- European project (<http://www.strong-2020.eu>)
- WP21 — JRA3 PrecisionSM: “*Hadron Physics for Precision Tests of the Standard Model*”
- Goal: combine theory and experiment for precision tests SM & BSM
- **Task 2: Hadronic Effects in Precision Tests of the electromagnetic sector of the Standard Model: Muon  $g-2$ :**
  - 2.1 Hadronic Vacuum Polarization from spacelike and timelike processes
  - 2.2 Hadronic Light-by-Light Scattering Contribution to  $(g - 2)\mu$
- Deliverable for Task 2.1:
  - database for low-energy hadronic cross sections in  $e^+e^-$  collisions.

- Collaboration:
  - 35 participants (from main e+e- experiments)
- 3 Meetings (from June 2020)
- Next meeting (online):  
“Workshop on Timelike vs Spacelike HVP” 24-25-26 November 3-6pm CET

If you are interested please send a mail to [gvenanzo\(at\)gmail.com](mailto:gvenanzo@gmail.com) and/or to [Andrzej.Kupsc\(at\)physics.uu.se](mailto:Andrzej.Kupsc@physics.uu.se)

# 1st Meeting on database on hadronic cross sections

📅 Wednesday 3 Jun 2020, 10:00 → 12:00 Europe/Rome

**10:00** → 10:10 **Introduction PrecisionSM/STRONG2020**

- **Procedure:**

- Precision SM web page (<https://precision-sm.github.io/>)
- Input data (from HEPData)
- Check of «consistency» of input data
- Responsive Plots
- (Possible) Production of useful quantities (VP,  $\alpha_{EM}$ , Adler Function...)
- Maintenance of the web page and polling to HEPData

Differential cross section for  $e^+e^- \rightarrow \pi^+\pi^-\gamma$ , with  $50^\circ < \theta_\gamma < 130^\circ$

**Abstract (data abstract)**  
 We have measured the cross section of the radiative process  $e^+e^- \rightarrow \pi^+\pi^-\gamma$  with the KLOE detector at the Frascati  $\phi$ -factory DAΦNE, from events taken at a CM energy  $W=1$  GeV. Initial state radiation allows us to obtain the cross section for  $e^+e^- \rightarrow \pi^+\pi^-$ , the pion form factor  $|F_\pi|^2$  and the dipion contribution to the muon magnetic moment anomaly,  $\Delta a_\mu^{\pi\pi} = (478.5 \pm 2.0_{\text{stat}} \pm 5.0_{\text{stat}} \pm 4.5_{\text{th}}) \times 10^{-1}$  in the range  $0.1 < M_{\pi\pi}^2 < 0.85$  GeV<sup>2</sup>, where the theoretical error includes a SU(3) ChPT estimate of the uncertainty on photon radiation from the final pions. The discrepancy between the Standard Model evaluation of  $a_\mu$  and the value measured by the Muon g-2 collaboration at BNL is confirmed.

**Figure 3a** Data from Fig. 3, Left and Table 2

## Web site collaborative framework

- ▶ source web site files on Github repository
- ▶ Nikola static web generator generates website (= HTML, CSS and javascript)
- ▶ simple procedure to publish on Github Pages at <https://precision-sm.github.io/>
  - ▶ generated web site can be published anywhere else if more convenient
- ▶ web pages are edited in simplified markup languages like Markdown
  - ▶ but HTML, CSS and Javascript can be used if desired
- ▶ collaborators can be added as editors of Github repository
- ▶ written, tested and documented procedure to convert data into responsive jsRoot plots (<https://precision-sm.github.io/posts/mk-hepdata-plot/>)

## Next steps

- ▶ responsive plot feature of channel selection (know how to do it, just matter of available time)
- ▶ collect list of measurements to be uploaded to HEPData.net
- ▶ organize and collaborate with experiments to upload the measurements' data
- ▶ produce responsive plots from data uploaded on HEPData.net (semi-automatic)
- ▶ document measurements in web site
  - ▶ link to HEPData.net, inspirehep, brief description, plots
- ▶ organize measurements in categories
- ▶ publish example code pieces: data downloading, elaborations

Thanks for your attention!

# Conclusions

- A lot of effort to refine/improve HVP determination:
  - MUone at CERN (spacelike approach)
  - RadioMonteCarLow activity for RC's on e+e- (timelike) data
  - STRONG2020 database activity of e+e- (timelike) data

If you are interested to contribute you are welcome!

## Introduction

### goals (my view)

- ▶ build repository of low-energy precision measurements data
  - ▶ in a format and with instructions and examples to be readily usable
- ▶ provide instances of elaborations of the data, e.g. calculation of (part of) muon  $g-2$  HVP contribution

### on-going work

- ▶ focus on measurements of  $\sigma(e^+e^- \rightarrow \text{hadrons})$  to compute HVP & LBL contributions to muon  $g-2$
- ▶ rely on [HEPData.net](https://hepdata.net) as measurements repository
  - ▶ check existing data, promote / organize data submissions
- ▶ setup collaborative web site that links to measurement data on HEPData.net and organizes the content
- ▶ provide code examples that download and elaborate data of precision measurements
- ▶ git repository used to store web site content with versioning
- ▶ eventually, additional git repository(ies) will store more complex code examples

# Systematic Effects: Multiple Coulomb Scattering

Effect of a flat error of 1% on the core width of multiple scattering

# Systematic Effects: Beam Energy scale

- M2 beam average energy scale known at  $\sim 1\%$
- Beam muon momentum measured by the COMPASS BMS spectrometer with  $\sim 0.8\%$  resolution
- Absolute energy scale has to be controlled by a physics process:
  - ❖ Inverse kinematic method on elastic  $\mu e$  events
  - ❖ Fit of the average angle distribution
- Can reach  $< 3$  MeV uncertainty in a single station in less than one week

Effect of a syst shift of the average beam energy on the  $\theta_\mu$  distribution:  
1h run / 1 station
