

Project 5: Challenge 1

Challenge 1

Identify a particle species from its track in a detector using the convolutional neural network method

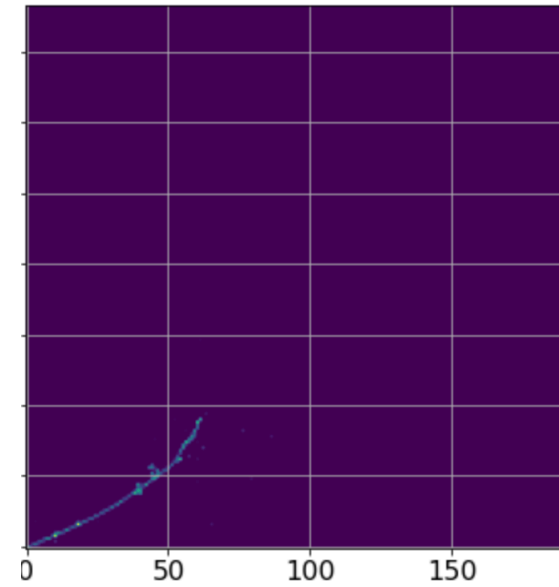

Muon

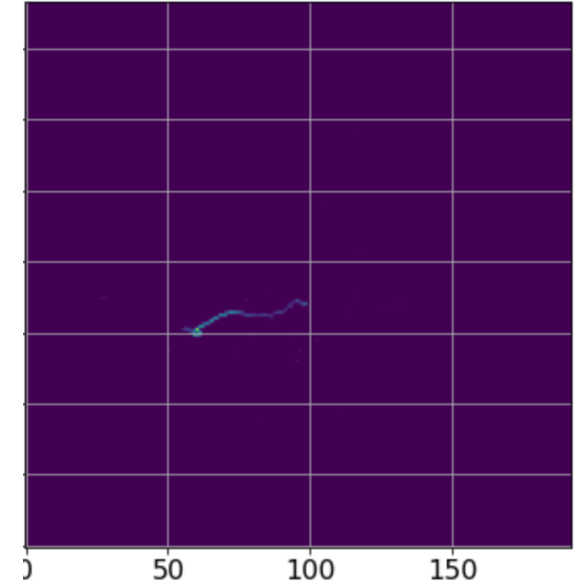

Proton

Electron

Photon

CNN algorithm used

Data Set

Train_data : 360,000 images (each has 192×192 pixels)

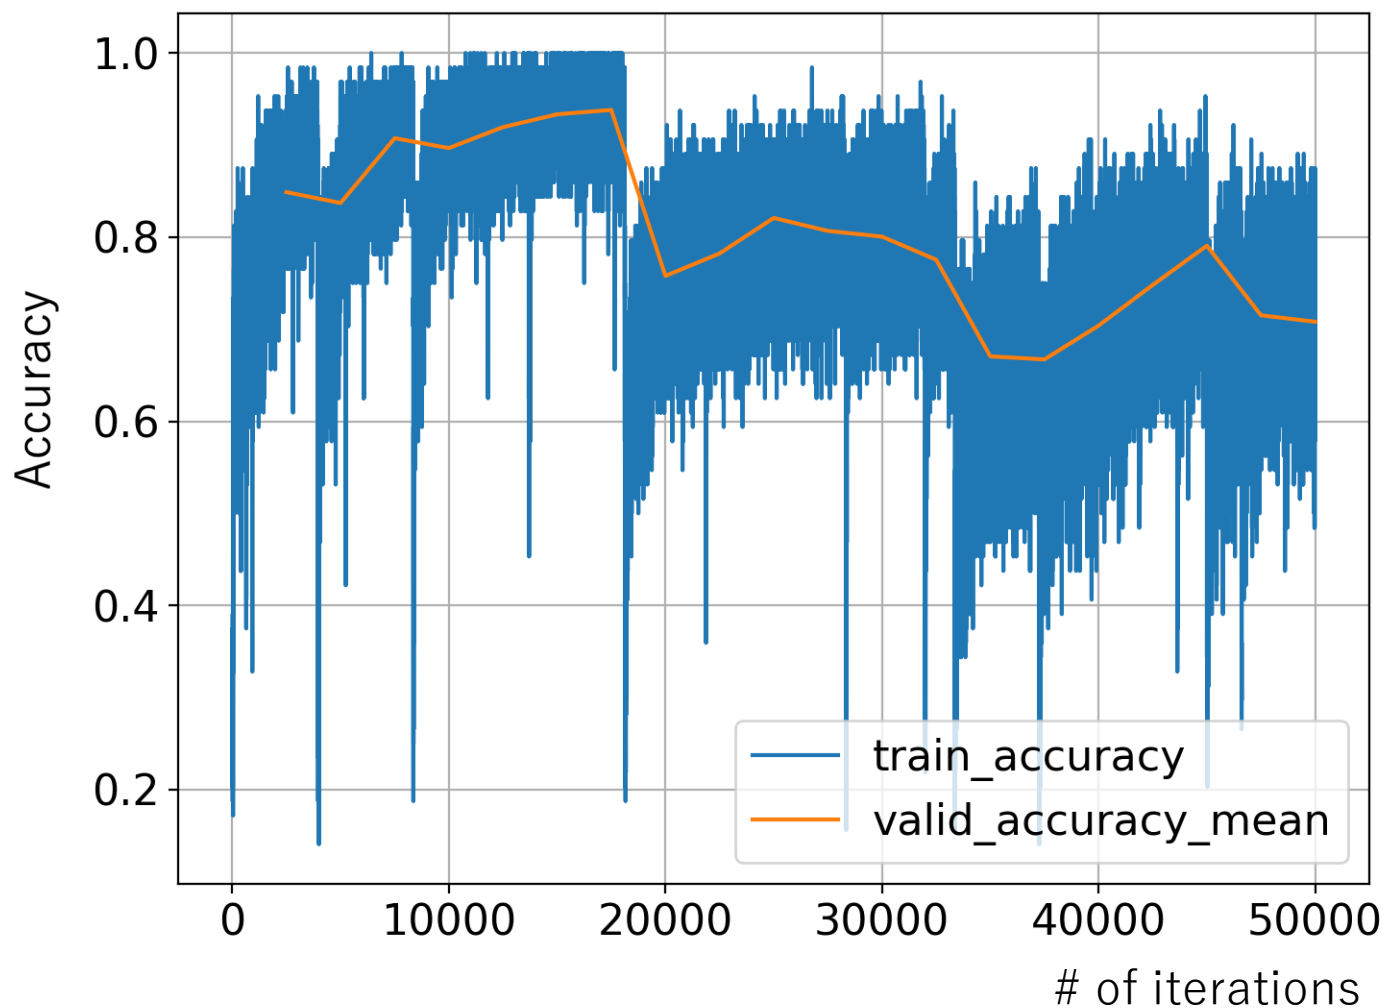

Average load time using DataLoader : 0.07 s for a batch of 64 images

Validation data : 40,000 images

Test data : 100,000 images

What is the best iteration steps ?

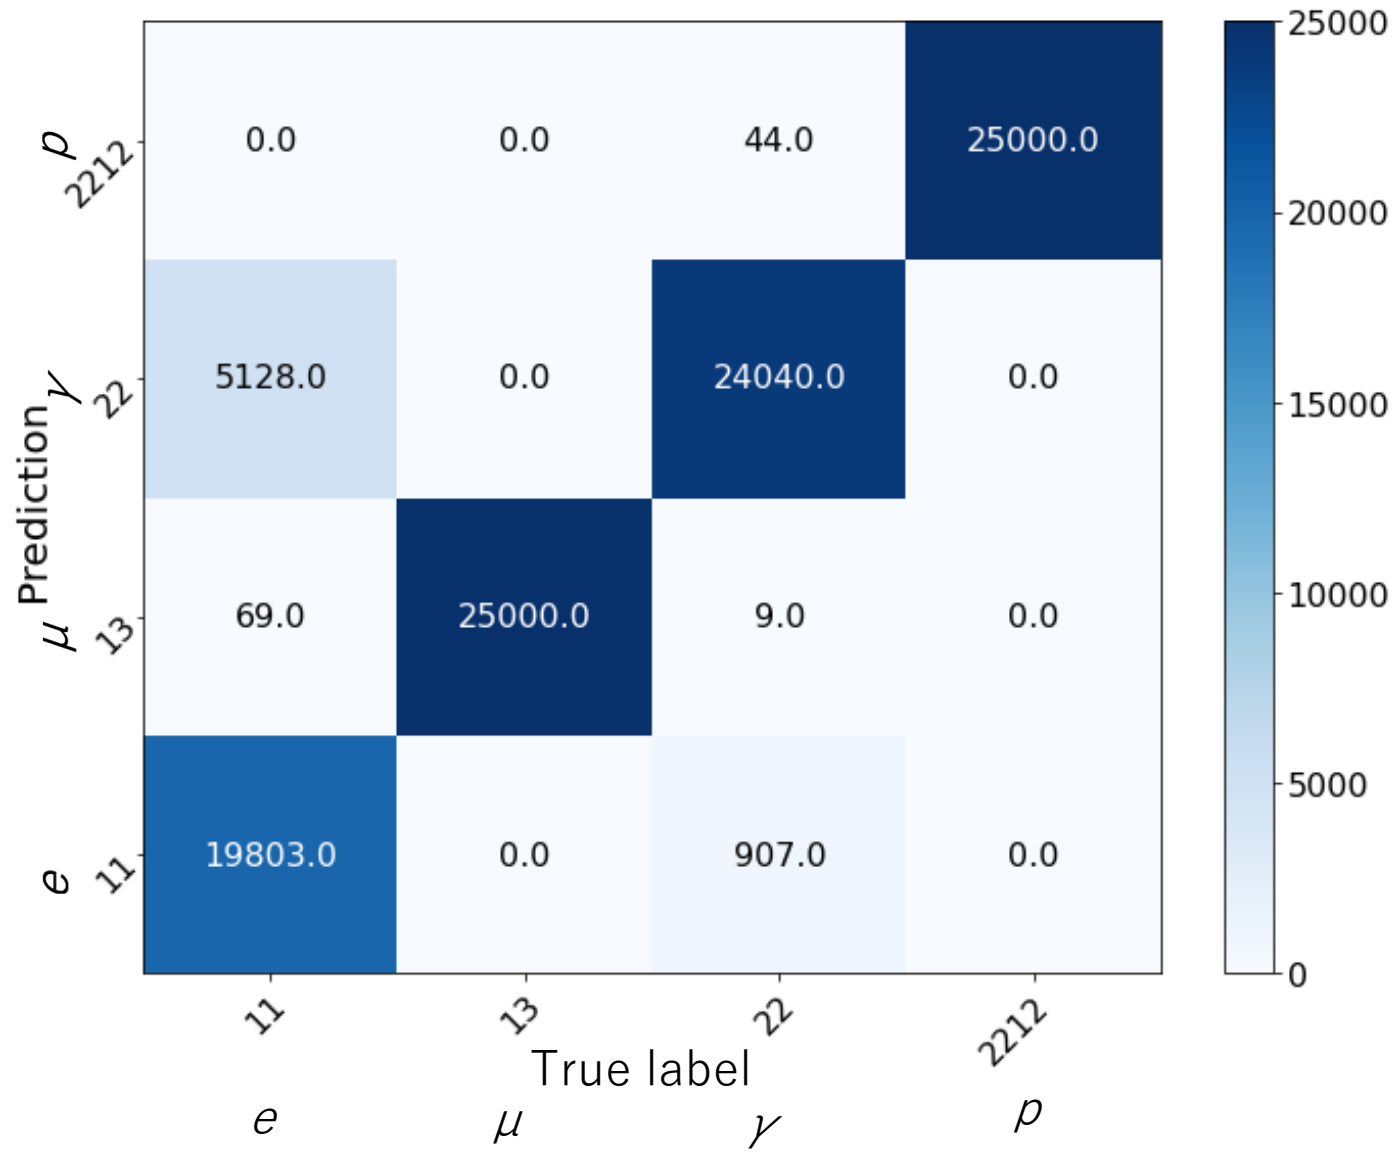

=> 17,500 steps

? Periodical up & down

Confusion matrix

Accuracy : 94 % (NN : after 17,500 iterations)

Electrons & photons tend to be confused.
-> photoelectron effect

How to distinguish b/w Electrons & photons ?
