

# Possible implications of 750 GeV diphoton excess @ LHC

Pyungwon Ko (KIAS)

WRU Symposium 2016,  
“Interplay between LHC and flavor physics”  
KMI, Nagoya U, March 13-14 (2016)

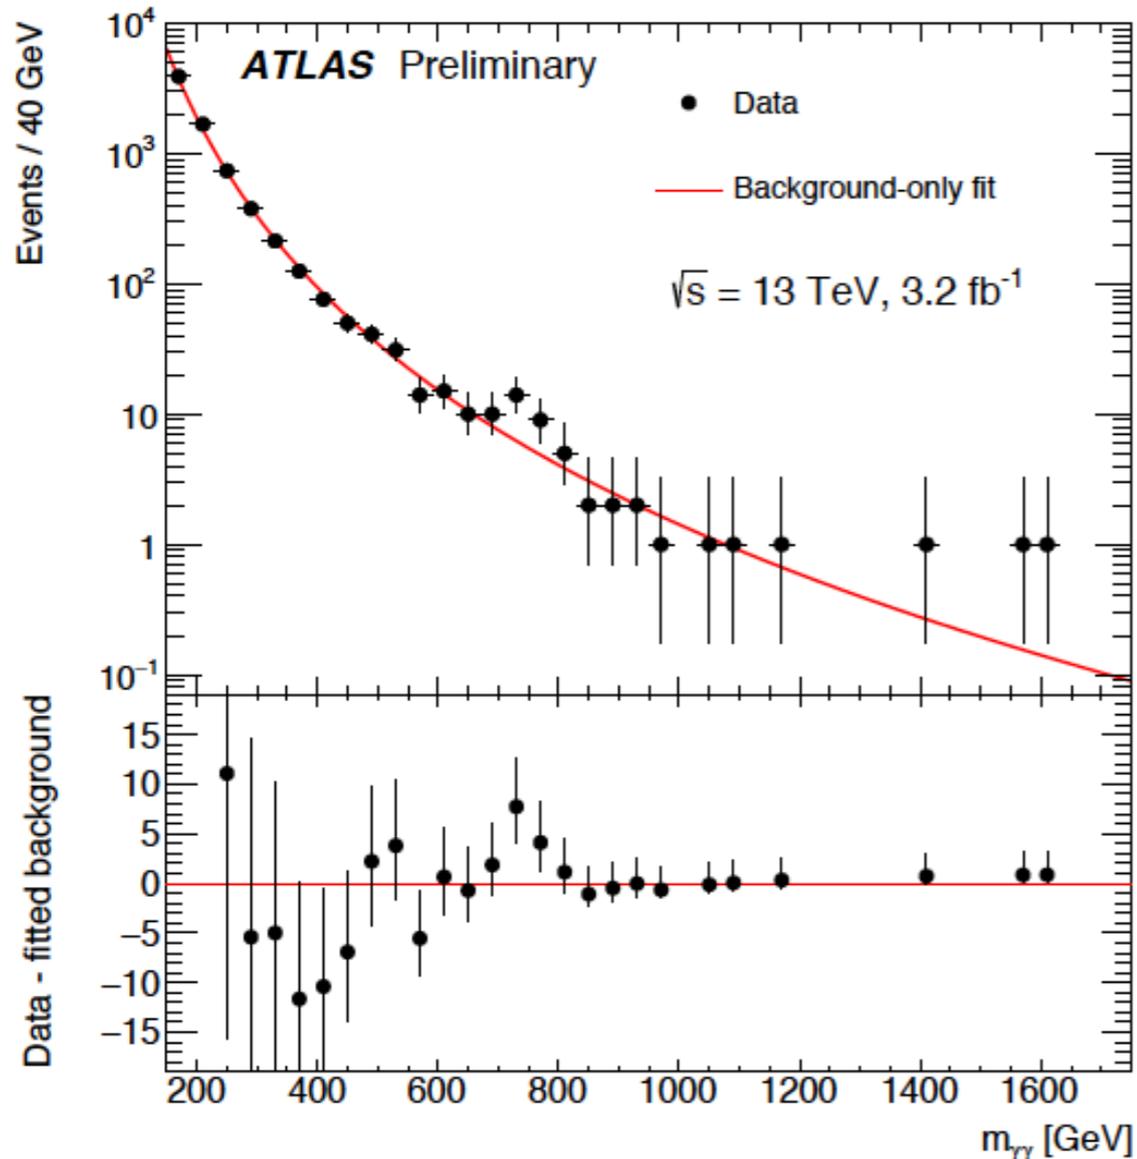

# Contents

- 750 GeV Diphoton excess at the LHC
- Model I :  $E_6$  motivated leptophobic  $U(1)'$  model
- Model II : Dark Higgs interpretation of diphoton excess
- Model III : Composite Models (??)
- Closing remarks

750 GeV diphoton  
excess at the LHC

1. Introduction

# Diphoton excess at 750 GeV

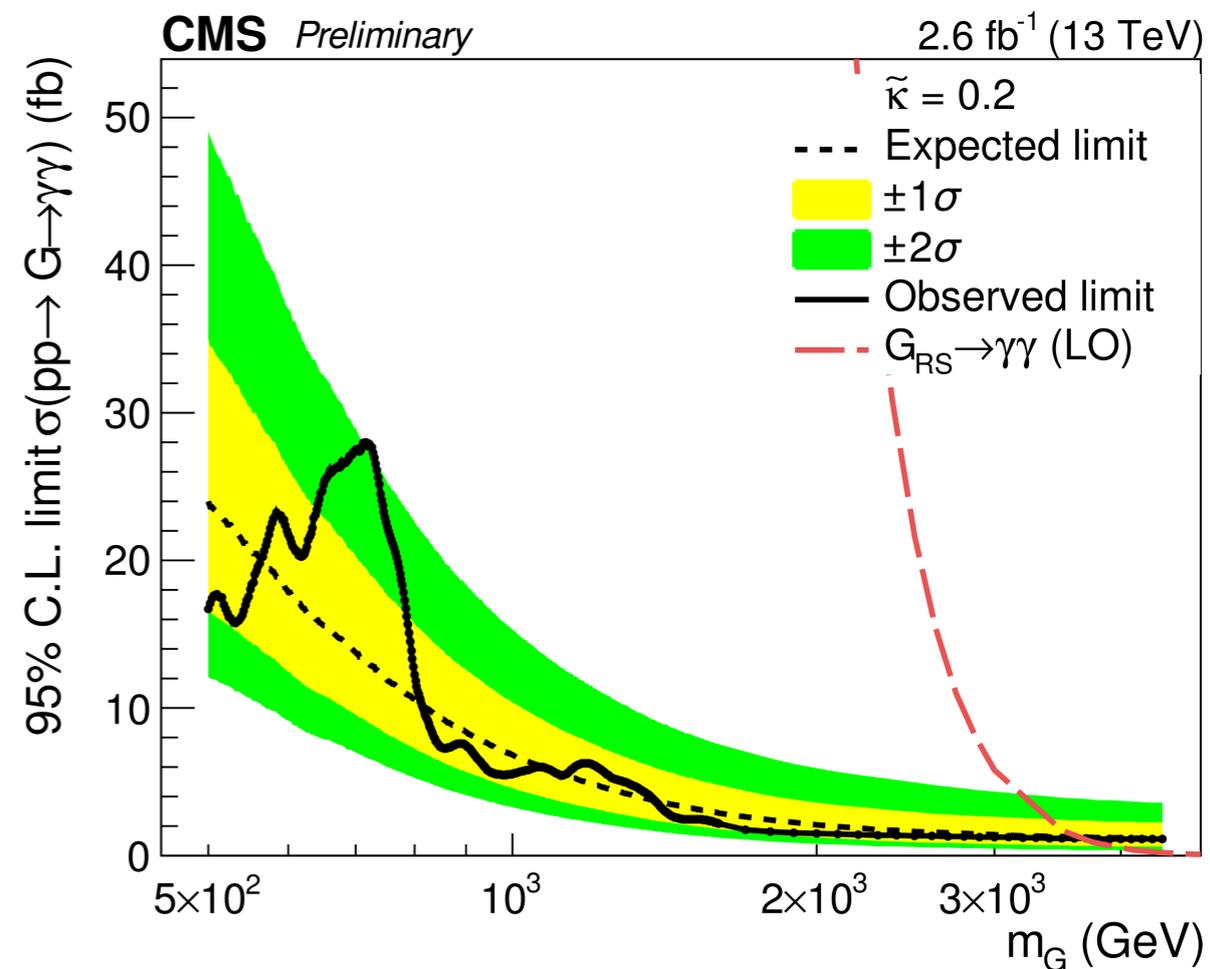

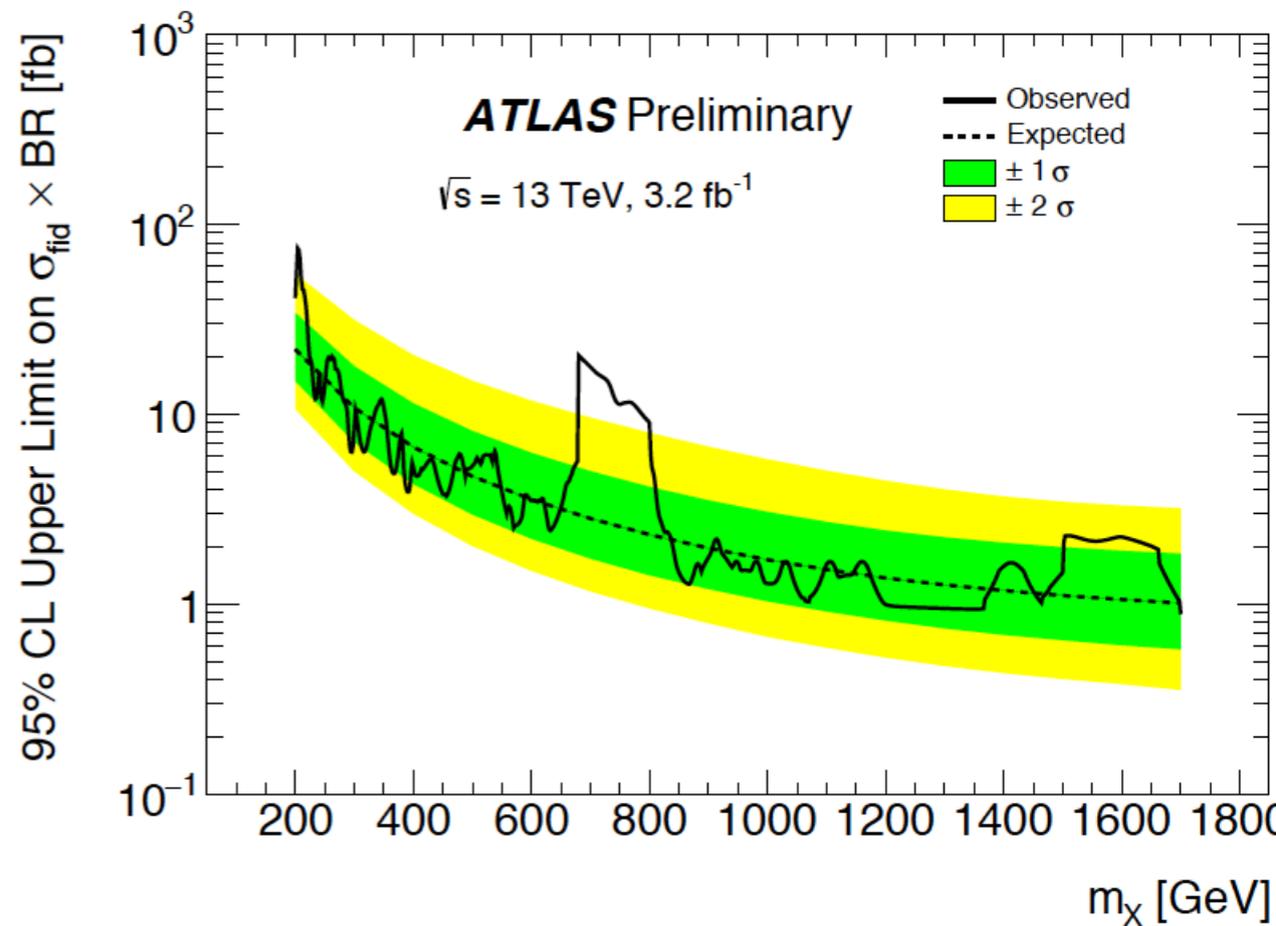

ATLAS-CONF-2015-081, CMS-PAS-EXO-15-004

**Both ATLAS and CMS observed bump on diphoton invariant mass distribution**

3.6  $\sigma$  : ATLAS

2.6  $\sigma$  : CMS

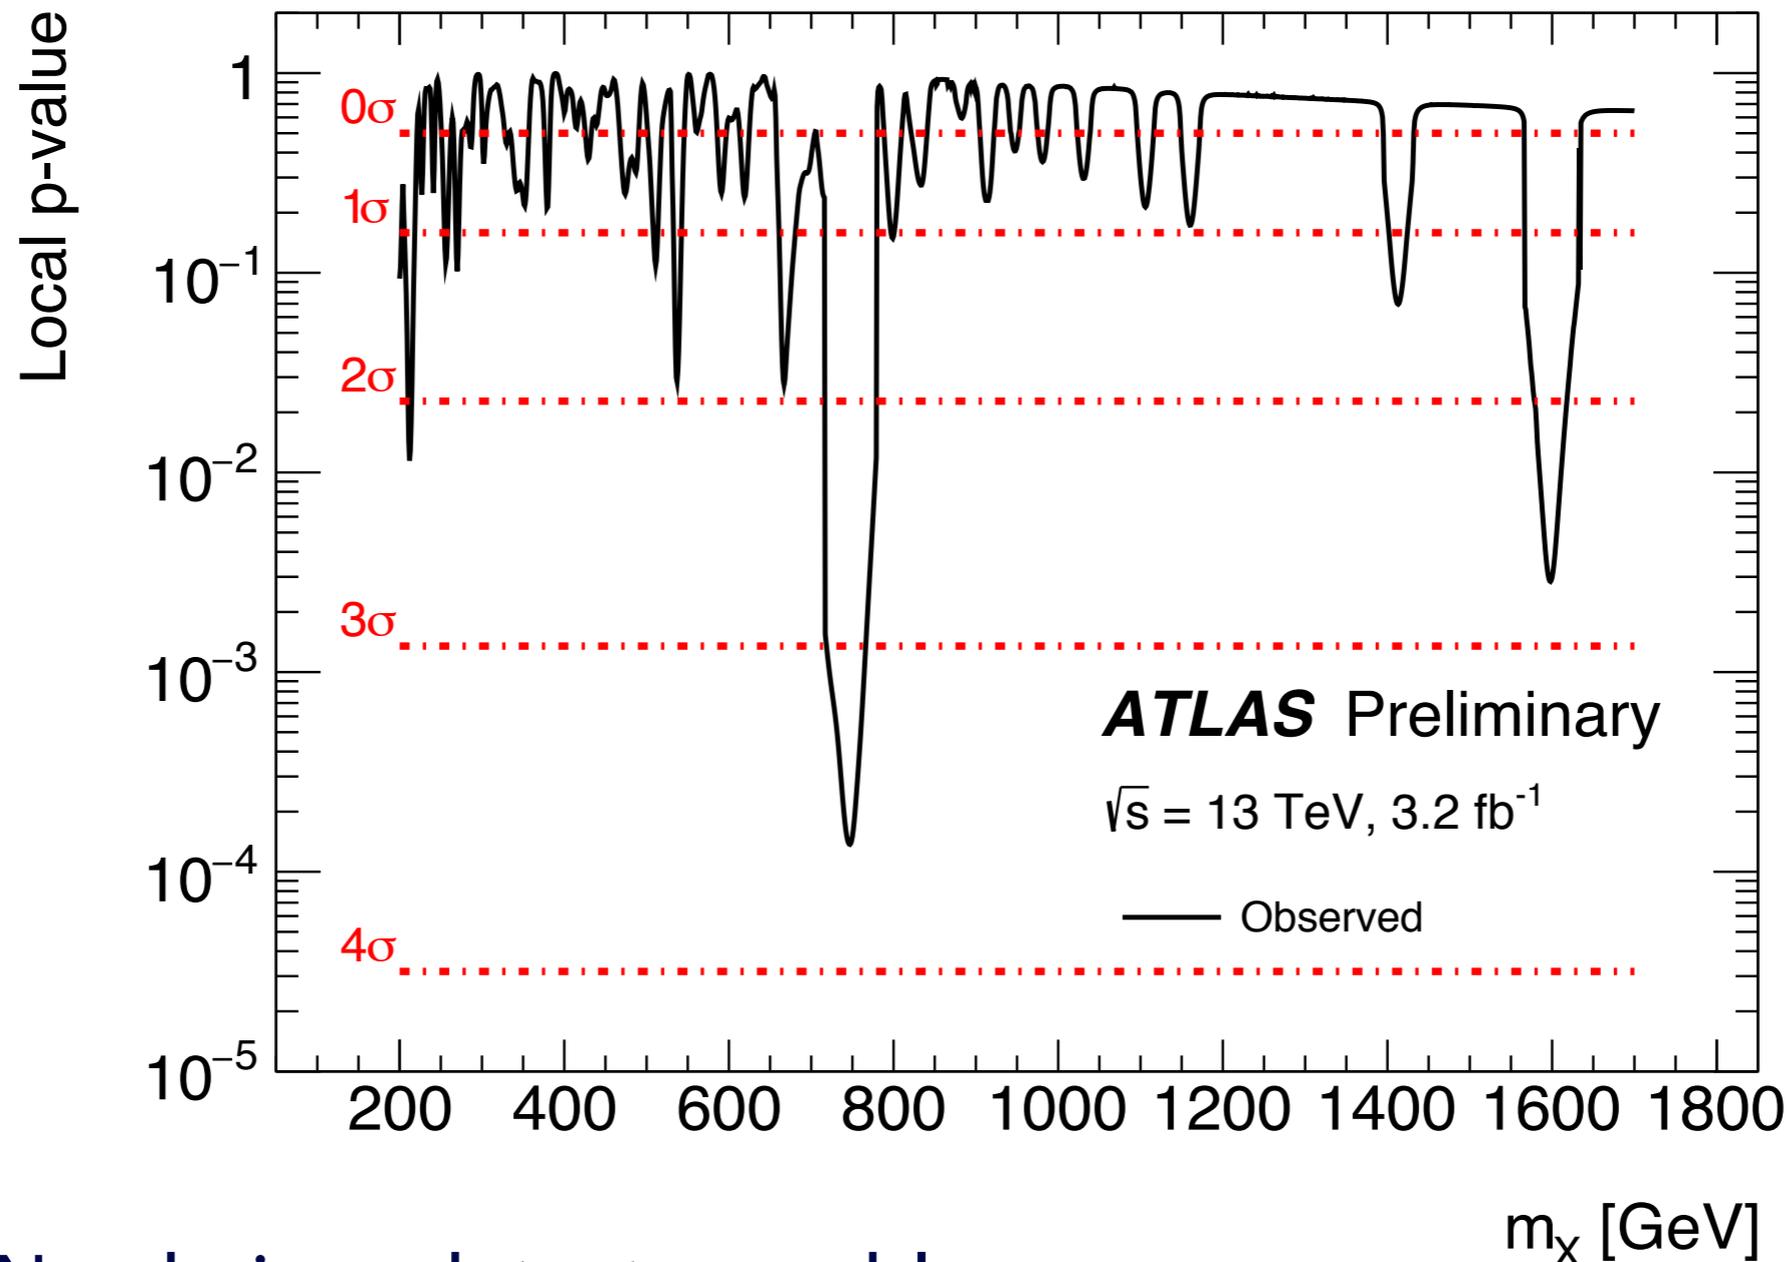

(Local significance)

# Diphoton

Slides from Koji Terashi's talk

"Higgs-like" NWA scan  $\rightarrow$  local(global)  $3.6(2.0)\sigma$  excess around 750 GeV

- No obvious detector problems
- Event characteristics : consistent with mass sideband
- $\sim 1.5\sigma$  pull of photon energy resolution systematics

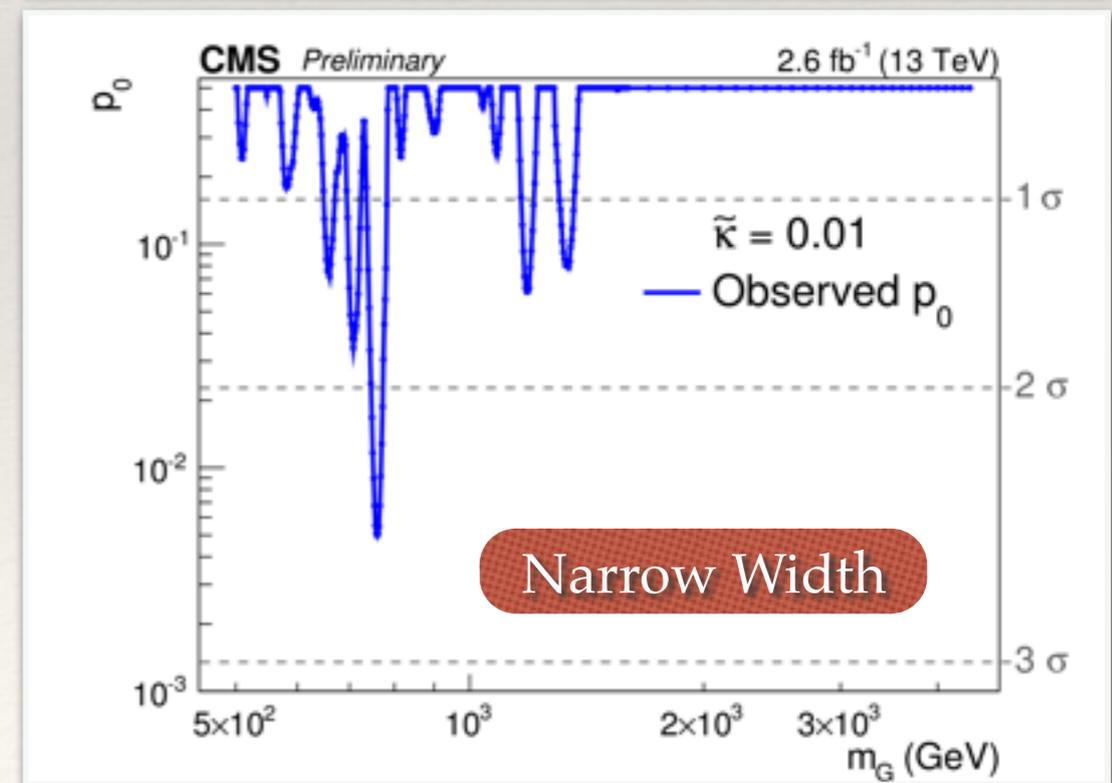

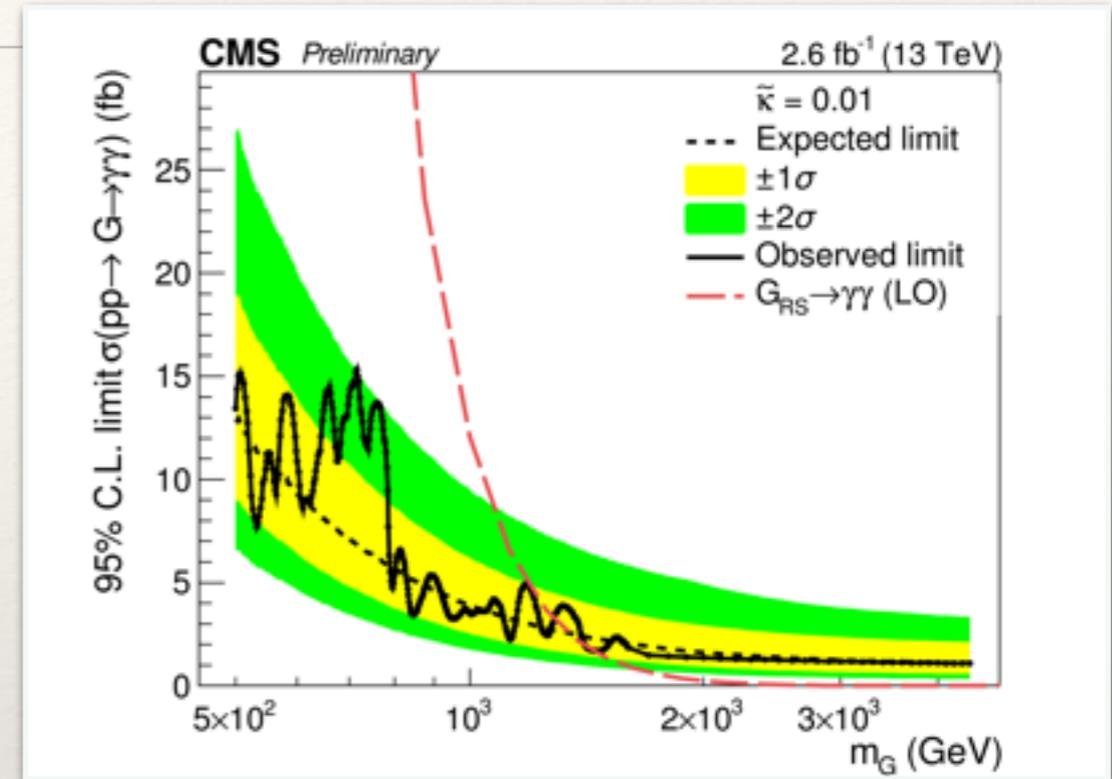

# Diphoton

Slides from Koji Terashi's talk

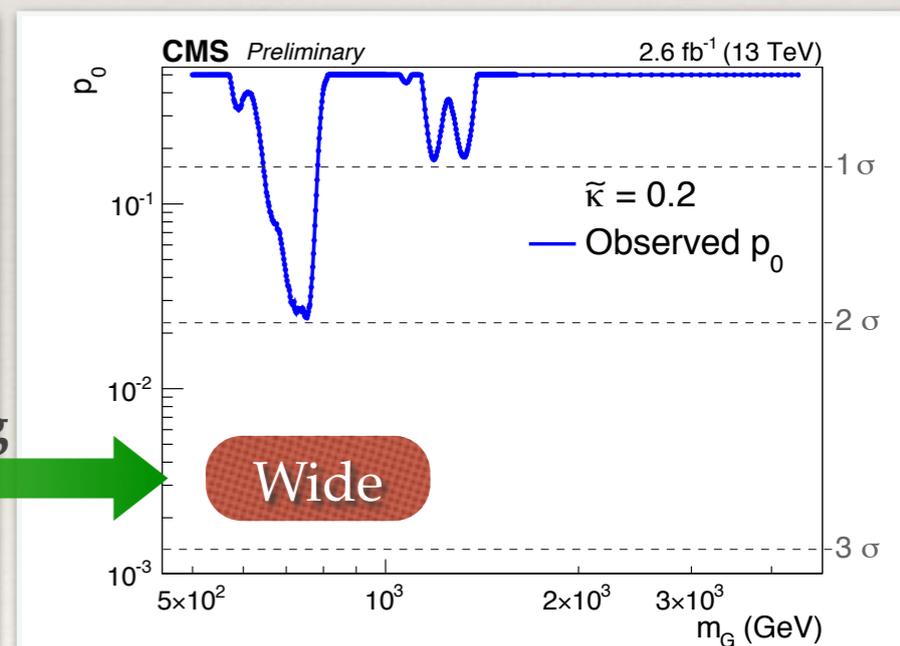

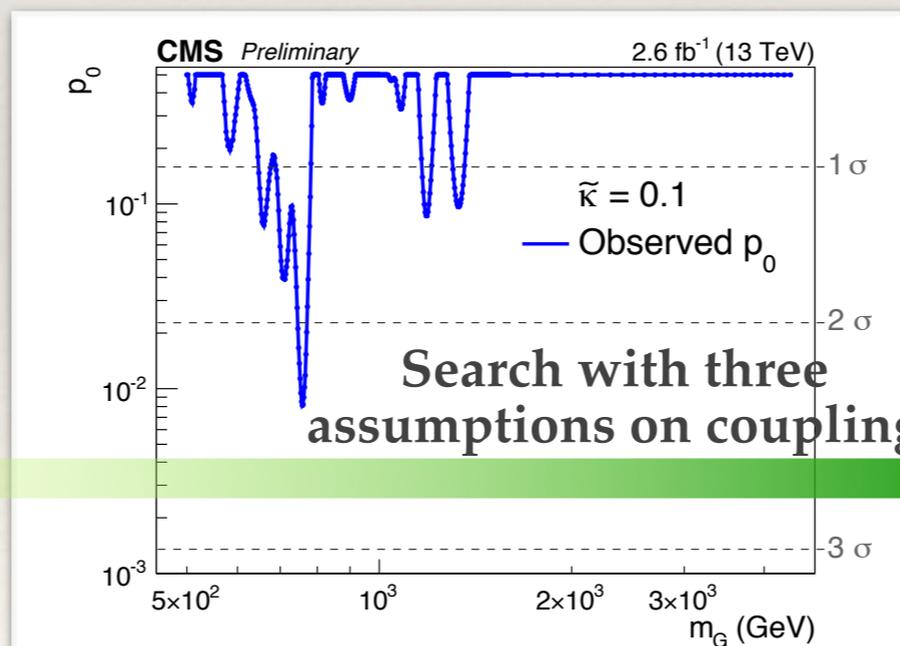

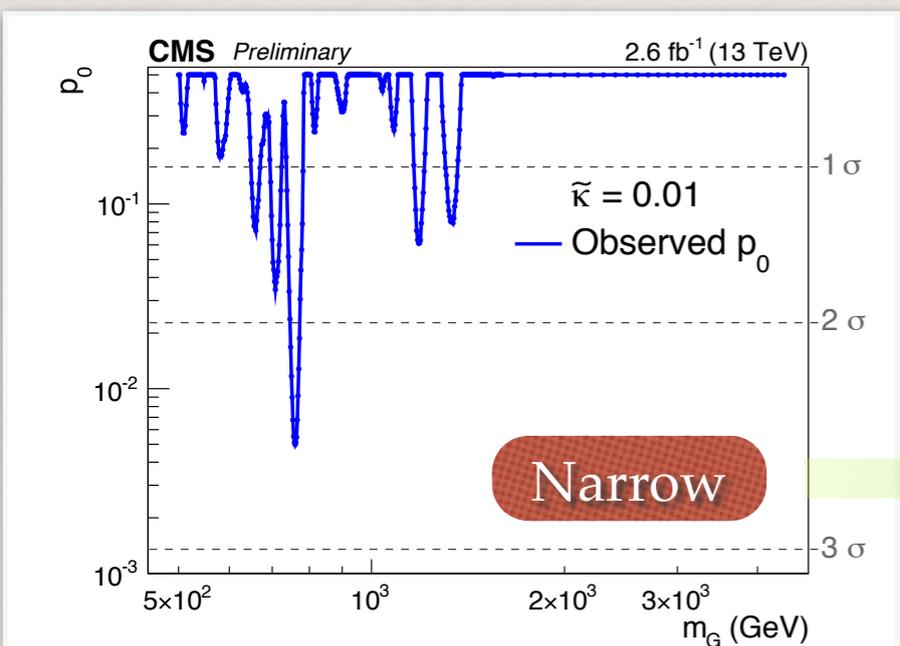

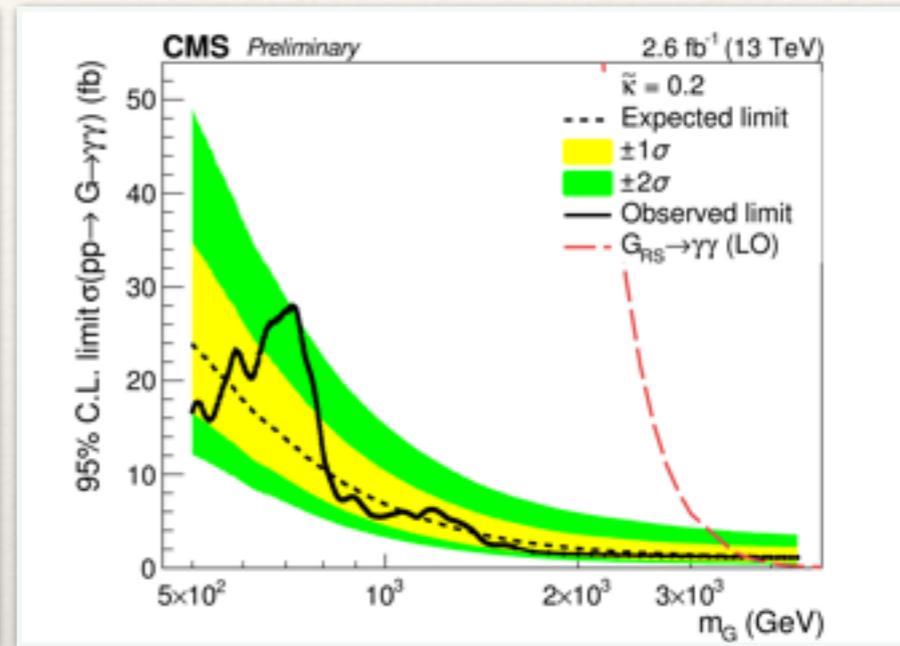

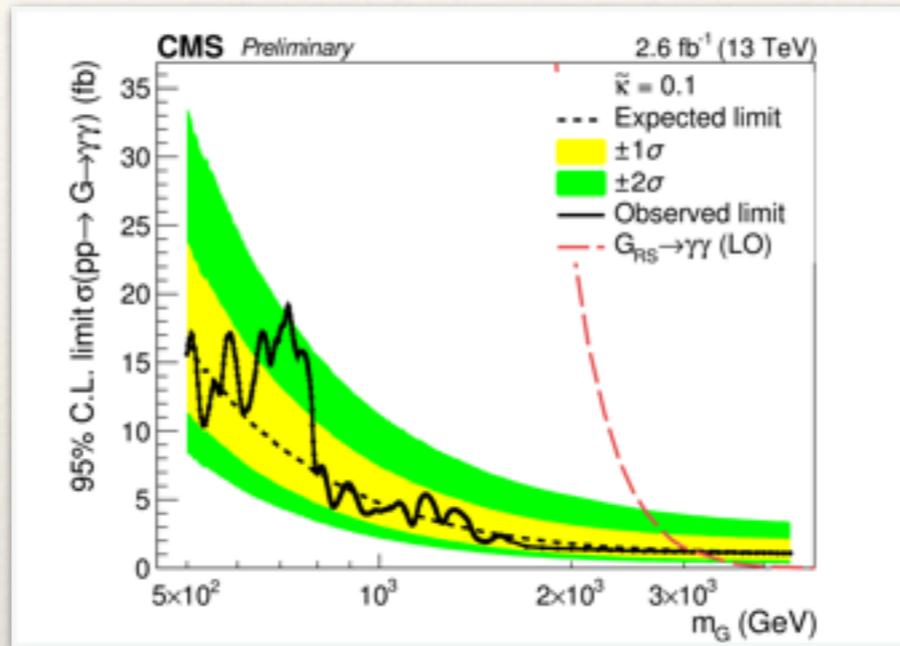

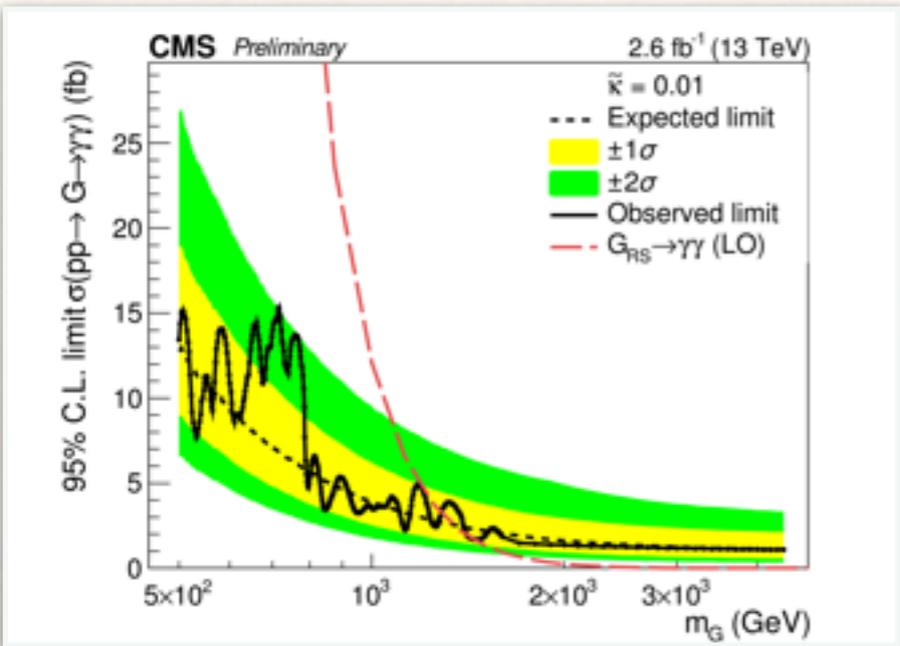

- 2D mass-width scan (mass = 200-2000 GeV, width = 1-10%)
  - ▶ Local(global) 3.9(2.3) $\sigma$  excess around 750 GeV
  - ▶ Best fit  $\Gamma/m \sim 6\%$  ( $\Gamma \sim 45\text{GeV}$ )
- Compatible with Run 1 at 2.2(1.4) $\sigma$  level for NWA (6% LWA) under gg hypothesis

# Diphoton Resonances (cont.)

- ❖ **Statistical interpretation based on the  $m$  spectrum for the search of diphoton resonances.**
- ❖ Modeling in the interpretation:
  - ❖ Signal – interpolation of MC signal (spin-2 assumed)
  - ❖ Background – parametric fit to data.
- ❖ Excesses in two categories are not in the same mass window:
  - ❖ “wide excess”: incompatible in terms of scale and resolutions.
  - ❖ Sensitivity is driven by the EB-EB category (90%).
- ❖ **Maximum local significance:  $2.6\sigma$  at 760 GeV**

# Diphoton Resonances (cont.)

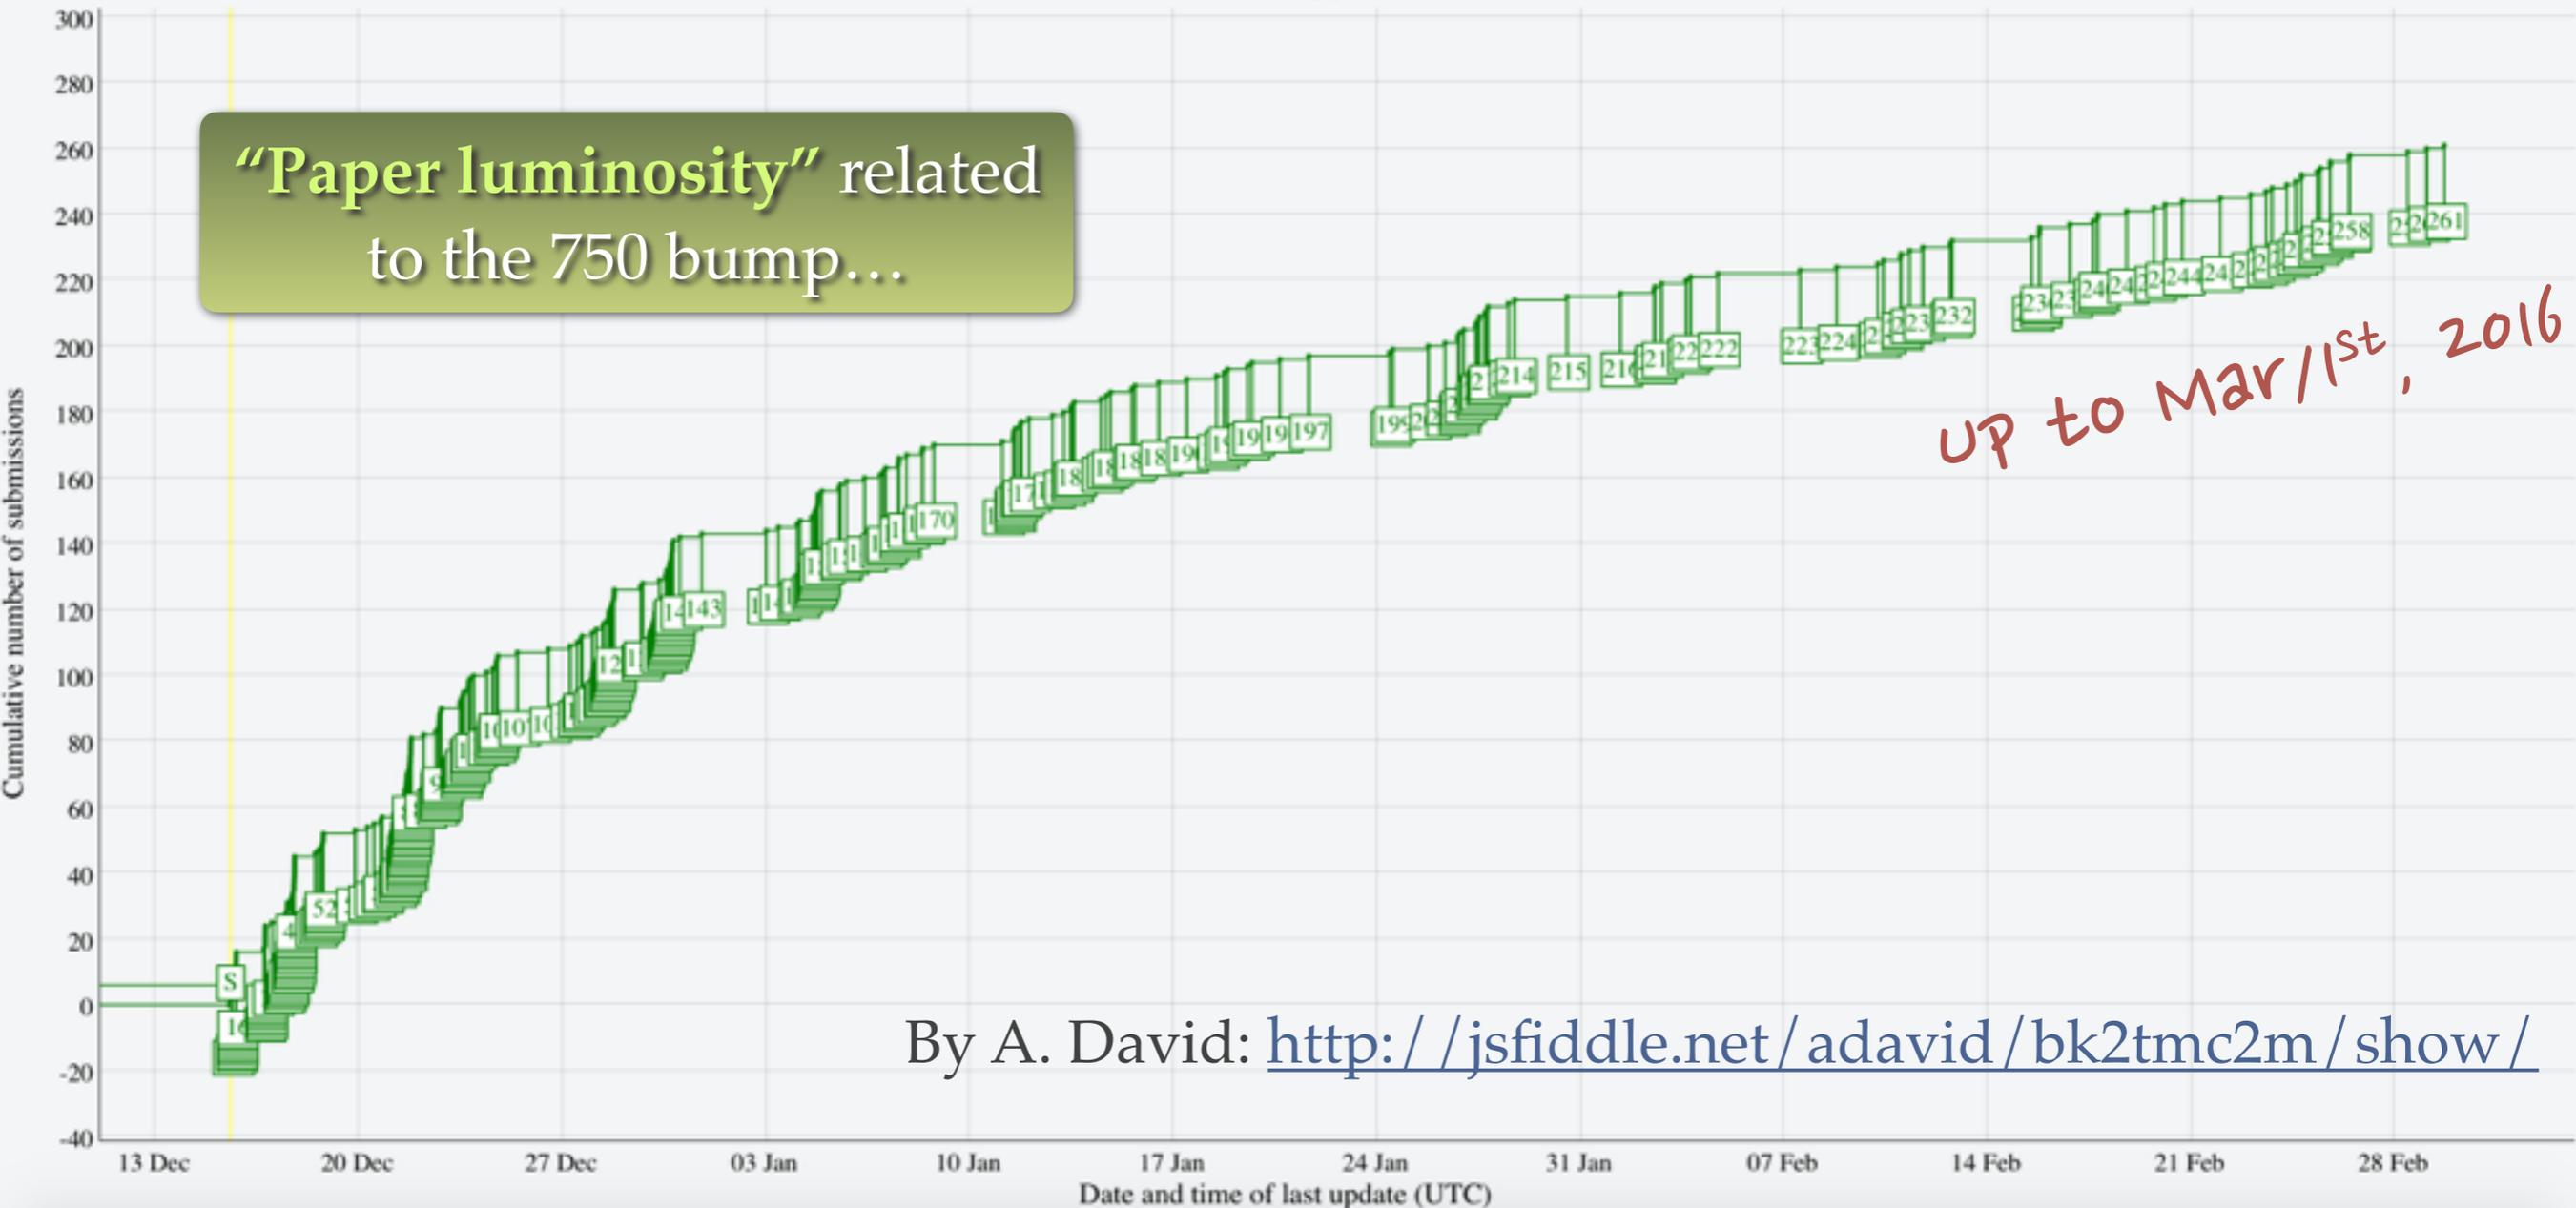

Search with three assumptions on coupling

Including LEE (0.5 - 4.5 TeV; narrow width), global p-value < 1.2σ

# Well, 261 Citations So Far...

#Run2Seminar and subsequent  $\gamma\gamma$ -related arXiv submissions

We are living in  
a very exciting era !

We are living in

Match 4 - Google DeepMind Challenge Match: Lee Sedol vs AlphaGo

**Google DeepMind**  
Challenge Match  
8 - 15 March 2016

**AlphaGo vs Lee Sedol**

Match 4 - **Livestream**  
13th March 13:00 KST, 04:00 GMT  
-1 day (12th March) 20:00 PT, 23:00 ET

Pre-Match Commentary starting at 12:45 KST,  
03:45 GMT -1day (12th March) 19:45 PT, 22:45 ET

Live from the Four Seasons Hotel Seoul!

The banner features a dark blue background with a grid of light blue circles. A stylized Go board pattern is visible on the left side. In the top right corner, there are icons for a clock and a share button. A large play button icon is centered over the match details.

Watch [AlphaGo](#) take on [Lee Sedol](#), the world's top Go player, in the fourth match of the Google DeepMind challenge.

# Properties of the diphoton excess

❖ Diphoton signal  $\rightarrow$  interpret as a resonance: spin-0 or 2

✧ **We consider a scalar boson in this talk**

❖ Cross section

$$\sigma(pp \rightarrow S)BR(S \rightarrow \gamma\gamma) \approx 3 - 10 \text{ fb}$$

❖ Width

Best fit value by ATLAS :  $\Gamma \sim 45 \text{ GeV}$

✓ Narrow width is also possible

❖ Absence of 750 GeV resonance with other decay modes

 BRs are constrained

# Properties of the diphoton excess

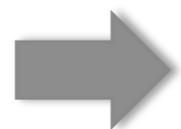

final state $f$	$\sigma$ at $\sqrt{s} = 8 \text{ TeV}$			implied bound on $\Gamma(S \rightarrow f)/\Gamma(S \rightarrow \gamma\gamma)_{\text{obs}}$
	observed	expected	ref.	
$\gamma\gamma$	$< 1.5 \text{ fb}$	$< 1.1 \text{ fb}$	[6, 7]	$< 0.8 (r/5)$
$e^+e^- + \mu^+\mu^-$	$< 1.2 \text{ fb}$	$< 1.2 \text{ fb}$	[8]	$< 0.6 (r/5)$
$\tau^+\tau^-$	$< 12 \text{ fb}$	$15 \text{ fb}$	[9]	$< 6 (r/5)$

$$r = \sigma_{13\text{TeV}} / \sigma_{8\text{TeV}}$$

$$\Gamma / M \approx 0.06$$

From Table 1 of arXiv:1512.04933 (Franceschini et. al.)

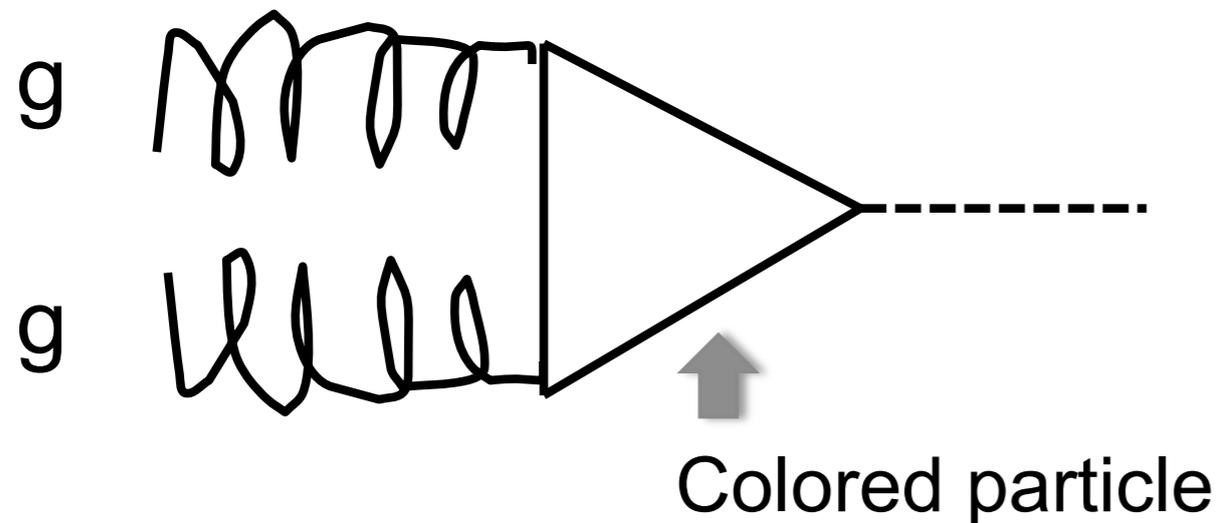

❖ Absence of 750 GeV resonance with other decay modes

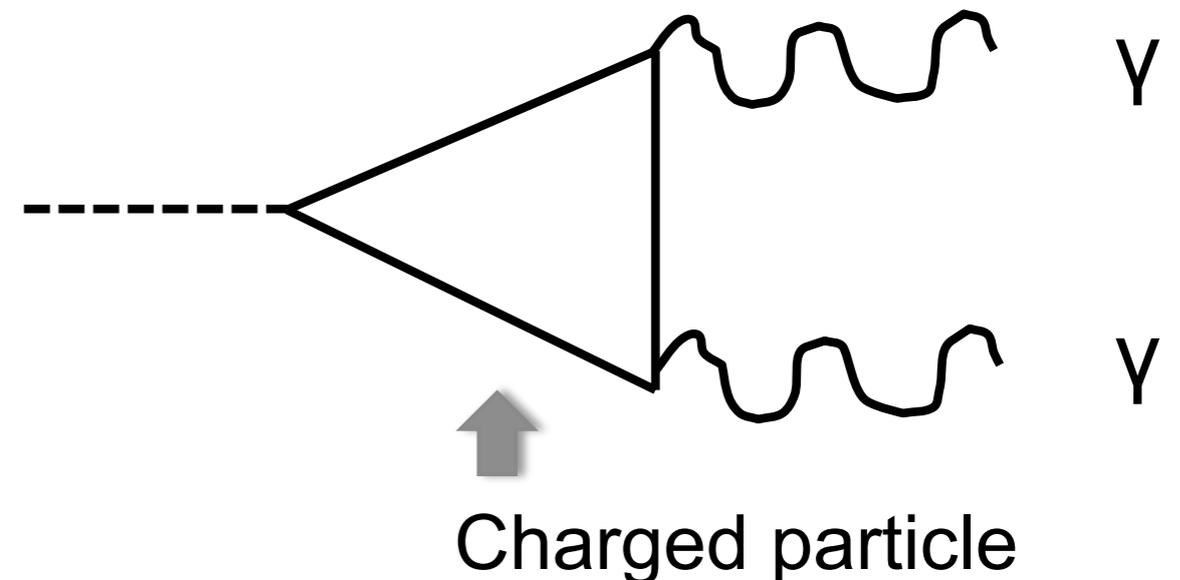

BRs are constrained

One scenario: gluon fusion + diphoton decay via loop

**Production: gluon fusion**

**Diphoton decay channel**

It is not easy to get  $\sigma(gg \rightarrow \Phi_{\text{New}}) \text{BR}(\Phi_{\text{New}} \rightarrow \gamma\gamma) \sim 5 \text{ fb}$

Ex) Two Higgs doublet Model (Type-II) (Angelescu, Djouadi, Moreau arxiv:1512.0492)

$$\sigma(gg \rightarrow H) \sim 850 \text{ fb} \times \cot^2\beta \quad \sigma(gg \rightarrow A) \sim 850 \text{ fb} \times 2\cot^2\beta$$

$$\text{BR}(H \rightarrow \gamma\gamma) \sim O(10^{-5}) \quad \text{BR}(A \rightarrow \gamma\gamma) \sim O(10^{-5})$$

**We need exotic colored and/or charged particles**

Let us discuss simple case of (SM) singlet scalar boson + exotic particles

# Basic Questions

- Raison d'être of (fundamental?) singlet scalar and vector-like fermions ? Completely singlet particles ?
- Can we generate  $\phi(750)$  decay width  $\sim 45$  GeV without any conflict with the known constraints ?
- Yes, if  $\phi(750)$  mainly decays into new particles
- Many examples : (i) Leptophobic  $U(1)'$  with fermions in the fundamental representation of  $E_6$ , (ii) Dark  $U(1)'$  plus dark sector, Dark Higgs decay into a pair of  $Z'$
- 750 GeV excss  $\sim U(1)'$  breaking scalar (Dark Higgs)

# 2HDM with $U(1)_H$ gauge sym

- 2HDM: one of the popular extensions of the SM Higgs sector
- Yukawa's and mass matrices cannot be diagonalized simultaneously  $\rightarrow$  neutral Higgs mediated FCNC problem
- Natural Flavor Conservation : usually in terms of  $Z_2$  (Glashow and Weinberg, 1977)

# Natural Flavor Conservation

(Glashow and Weinberg, 1977)

- Fermions of the same electric charge get their masses from the same Higgs doublet [Glashow and Weinberg, PRD (1977)] **NFC**
- Impose a discrete  $Z_2$  sym, and assign different  $Z_2$  parity to  $H_1$  and  $H_2$
- This  $Z_2$  is softly broken to avoid the domain wall problem

# However

- The discrete  $Z_2$  seems to be rather ad hoc, and its origin and the reason for its soft breaking are not clear
- We implement the discrete  $Z_2$  into a continuous local  $U(1)$  Higgs flavor sym under which  $H_1$  and  $H_2$  are charged differently [Ko, Omura, Yu PLB (2012)]
- This simple idea opens a new window for the multi-Higgs doublet models, which was not considered before

# Type-II 2HDM with U(1)H gauge symmetry

Ko, Omura, Yu: arXiv:1204.4588 [hep-ph]

Table 1: Matter contents in U(1)' model inspired by E<sub>6</sub> GUTs. Here,  $i$  denotes the generation index:  $i = 1, 2, 3$ .

Fields	SU(3)	SU(2)	U(1) <sub>Y</sub>	U(1)'	Z <sub>2</sub> <sup>ex</sup>
$Q^i$	<b>3</b>	<b>2</b>	1/6	-1/3	
$u_R^i$	<b>3</b>	<b>1</b>	2/3	2/3	
$d_R^i$	<b>3</b>	<b>1</b>	-1/3	-1/3	
$L_i$	<b>1</b>	<b>2</b>	-1/2	0	+
$e_R^i$	<b>1</b>	<b>1</b>	-1	0	
$n_R^i$	<b>1</b>	<b>1</b>	0	1

$D_L^i$	<b>3</b>	<b>1</b>	-1/3	2/3	
$D_R^i$	<b>3</b>	<b>1</b>	-1/3	-1/3	
$\tilde{H}_L^i$	<b>1</b>	<b>2</b>	-1/2	0	-
$\tilde{H}_R^i$	<b>1</b>	<b>2</b>	-1/2	-1	
$N_L^i$	<b>1</b>	<b>1</b>	0	-1	

# Basic Ingredients

- New vectorlike fermions which are chiral under new  $U(1)'$  : non-decoupling effects on  $X \rightarrow gg, \gamma\gamma$
- Diphoton at 750 GeV = Higgs boson from  $U(1)'$  sym breaking, mostly a SM singlet scalar
- All the masses from dynamical (Higgs) mechanism
- New decay modes to enhance the total decay rate

$$Z_2 : (H_1, H_2) \rightarrow (+H_1, -H_2).$$

TABLE I: Assignment of  $Z_2$  parities to the SM fermions and Higgs doublets.

Type	$H_1$	$H_2$	$U_R$	$D_R$	$E_R$	$N_R$	$Q_L, L$
I	+	-	+	+	+	+	+
II	+	-	+	-	-	+	+
III	+	-	+	+	-	-	+
IV	+	-	+	-	+	-	+

$$\begin{aligned}
 V(H_1, H_2) = & m_1^2 H_1^\dagger H_1 + m_2^2 H_2^\dagger H_2 + \frac{\lambda_1}{2} (H_1^\dagger H_1)^2 \\
 & + \frac{\lambda_2}{2} (H_2^\dagger H_2)^2 + \lambda_3 H_1^\dagger H_1 H_2^\dagger H_2 + \lambda_4 H_1^\dagger H_2 H_2^\dagger H_1. \quad (4)
 \end{aligned}
 \qquad
 \begin{aligned}
 \Delta V = & m_\Phi^2 \Phi^\dagger \Phi + \frac{\Lambda_\Phi}{2} (\Phi^\dagger \Phi)^2 + (\mu H_1^\dagger H_2 \Phi + \text{h.c.}) \\
 & + \mu_1 H_1^\dagger H_1 \Phi^\dagger \Phi + \mu_2 H_2^\dagger H_2 \Phi^\dagger \Phi, \quad (5)
 \end{aligned}$$

Soft  $Z_2$  breaking is replaced by spontaneous  
 U(1) Higgs gauge sym breaking

# Type-I Extensions

Models are anomaly free  
without extra chiral fermions

TABLE II: Charge assignments of an anomaly-free  $U(1)_H$  in the Type-I 2HDM.

Type	$U_R$	$D_R$	$Q_L$	$L$	$E_R$	$N_R$	$H_1$
$U(1)_H$ charge	$u$	$d$	$\frac{(u+d)}{2}$	$\frac{-3(u+d)}{2}$	$-(2u+d)$	$-(u+2d)$	$\frac{(u-d)}{2}$
$h_2 \neq 0$	0	0	0	0	0	0	0
$U(1)_{B-L}$	1/3	1/3	1/3	-1	-1	-1	0
$U(1)_R$	1	-1	0	0	-1	1	1
$U(1)_Y$	2/3	-1/3	1/6	-1/2	-1	0	1/2

See arXiv:1309.7256 for Higgs data analysis,  
arXiv:1405.2138 for DM (Ko, Omura, Yu)

# A Type-II Extension has all the necessary ingredients

Table 1: Matter contents in  $U(1)'$  model inspired by  $E_6$  GUTs. Here,  $i$  denotes the generation index:  $i = 1, 2, 3$ .

Fields	SU(3)	SU(2)	$U(1)_Y$	$U(1)'$	$Z_2^{\text{ex}}$
$Q^i$	<b>3</b>	<b>2</b>	1/6	-1/3

$N_L^i$	<b>1</b>	<b>1</b>	0	-1	

Fermions : 27 of  $E_6$  (!!!)  
 Scalar Bosons : 2 Doublets + 1 Singlet

# Yukawa couplings

The  $U(1)'$ -symmetric Yukawa couplings in our model are given by

$$V_y = y_{ij}^u \overline{u_R^j} H_1^\dagger i\sigma_2 Q^i + y_{ij}^d \overline{d_R^j} H_2 Q^i + y_{ij}^e \overline{e_R^j} H_2 L^i + y_{ij}^n \overline{n_R^j} H_1^\dagger i\sigma_2 L^i + H.c., \quad (16)$$

where  $\sigma_2$  is the Pauli matrix. The Yukawa couplings to generate the mass terms for the extra particles are

$$V^{\text{ex}} = y_{ij}^D \overline{D_R^j} \Phi D_L^i + y_{ij}^H \overline{\tilde{H}_R^j} \Phi \tilde{H}_L^i + y_{IJ}^N \overline{N_L^c} H_1^\dagger i\sigma_2 \tilde{H}_L^i + y_{IJ}^{\prime N} \overline{\tilde{H}_R^i} H_2 N_L^j + H.c. . \quad (17)$$

## Complex Scalar DM

One can introduce new  $Z_2^{\text{ex}}$ -odd scalar field  $X$  with the  $SU(3)_C \times SU(2)_L \times U(1)_Y \times U(1)_H$  quantum numbers equal to  $(1, 1, 0; -1)$ . Then the gauge-invariant Lagrangian involving  $X$  is given by

$$\begin{aligned} \mathcal{L}_X = & D_\mu X^\dagger D^\mu X - (m_{X0}^2 + \lambda_{H_1 X} H_1^\dagger H_1 + \lambda_{H_2 X} H_2^\dagger H_2) X^\dagger X - \lambda_X (X^\dagger X)^2 \\ & - \left( \lambda_{\Phi X}'' (\Phi^\dagger X)^2 + H.c. \right) - \lambda_{\Phi X} \Phi^\dagger \Phi X^\dagger X - \lambda_{\Phi X}' |\Phi^\dagger X|^2 \\ & - \left( y_{dX}^D \overline{d_R} D_L X + y_{LX}^{\tilde{H}} \overline{\tilde{L}} \tilde{H}_R X^\dagger + H.c. \right) \end{aligned} \quad (18)$$

# 125 GeV Higgs Data

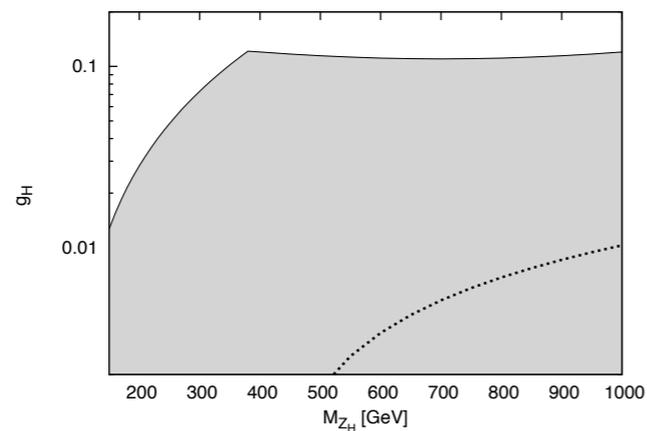

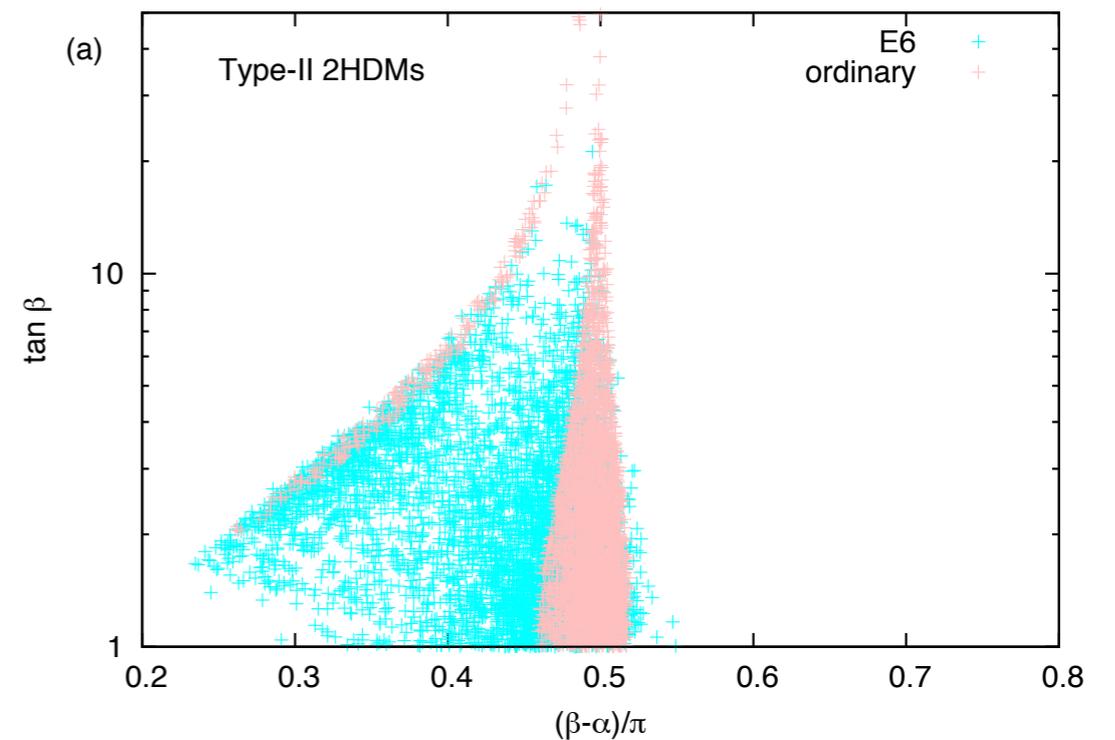

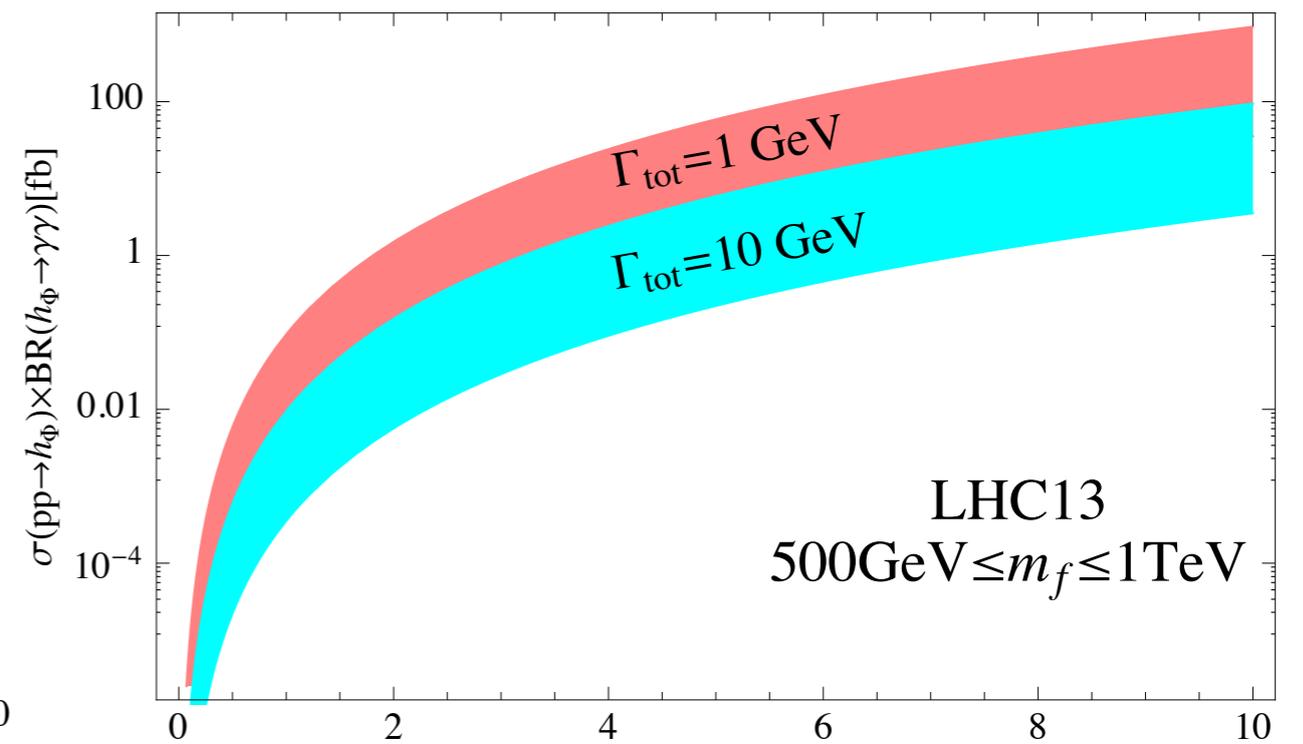

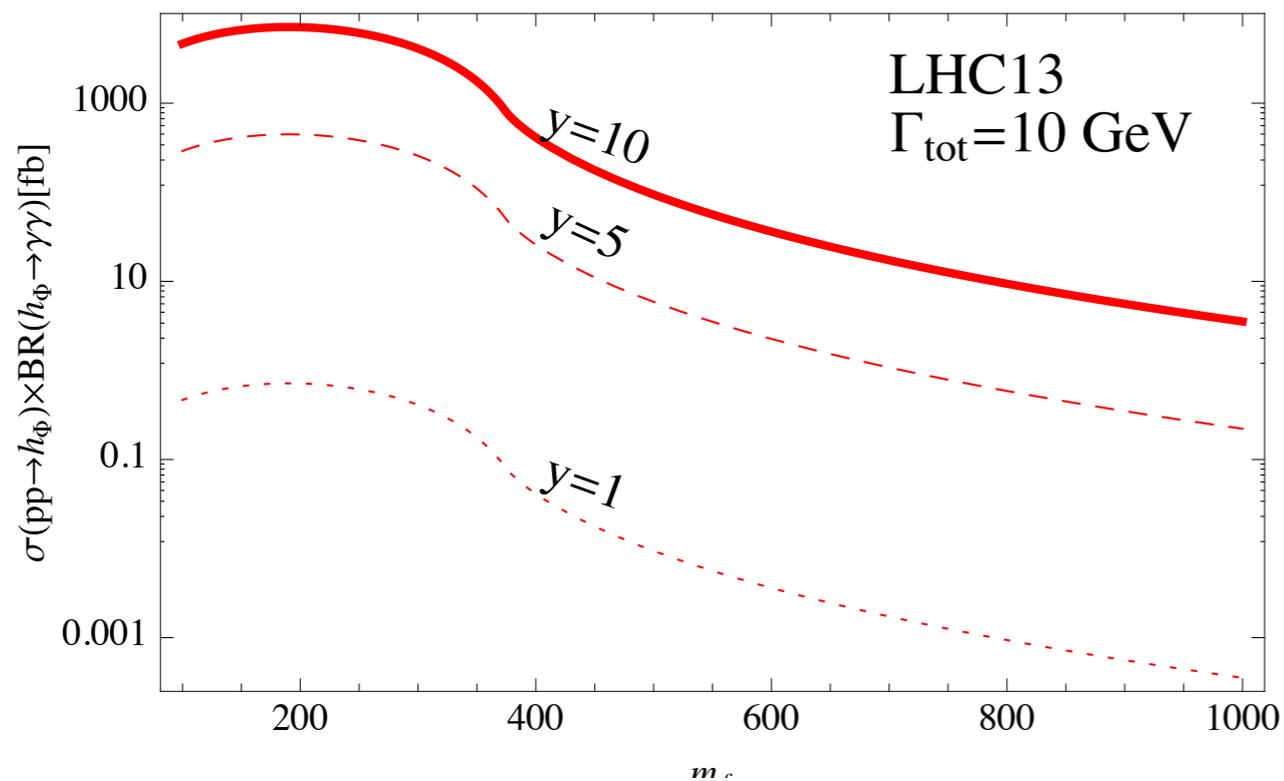

FIG. 1.  $M_{Z_H}$  and  $g_H$  in the type-II 2HDM $_{U(1)}$ . The dot line is the upper bound on the  $U(1)_\psi$  gauge boson, and the gray region is allowed for the  $U(1)_H (\equiv U(1)_b)$  gauge boson.

Qualitatively different from the ordinary Type-II 2HDM  
arXiv:1502.00262 (Ko, Omura, Yu)

# 750 GeV Diphoton Excess

Ko, Omura, Yu, arXiv:1601.00586

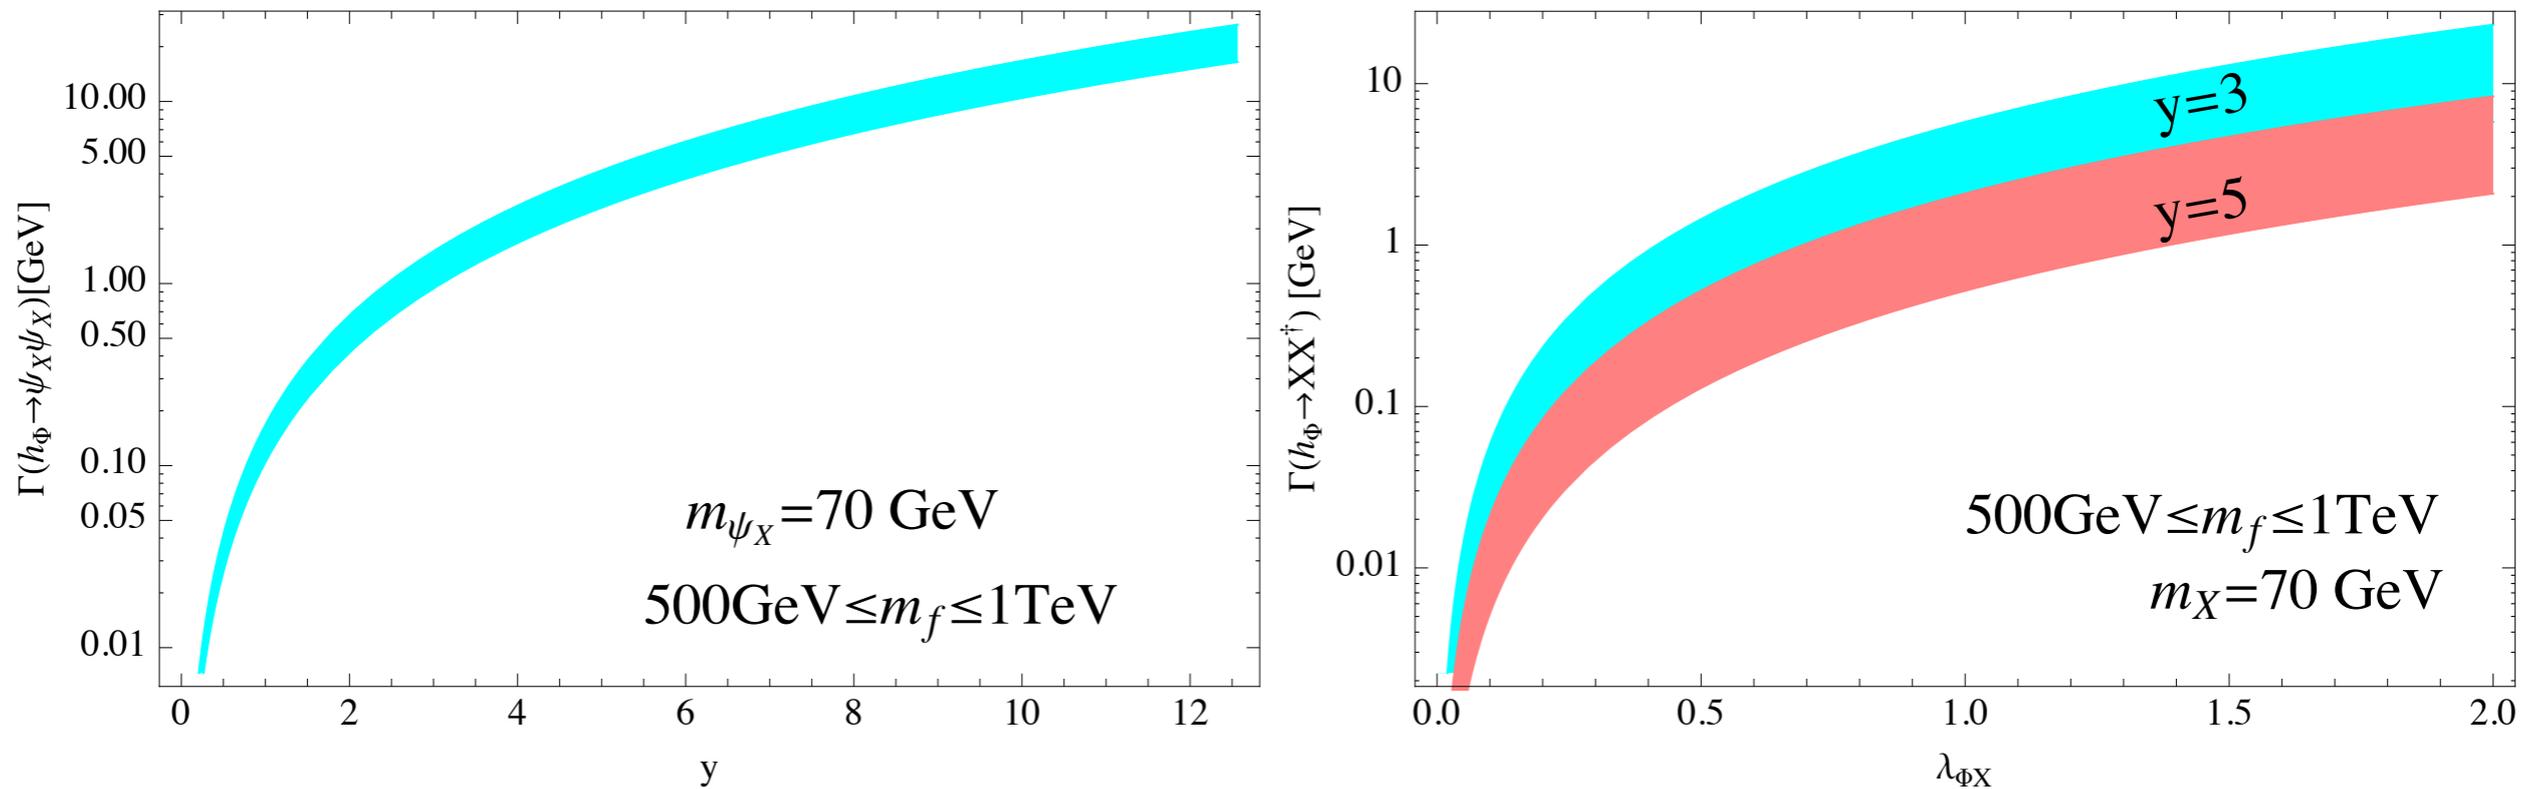

Figure 2:  $y$  vs. invisible decay width of  $h_\Phi$  (GeV) in the fermionic DM scenario (left) and scalar DM scenario (right). The vector-like fermion mass is between 500 GeV and 1 TeV on the cyan and pink bands. The dark matter masses are 70 GeV in the both cases.

# Constraints

Rescaled Run I limits

[Franceschini et al,  
1512.04933]

- Most can be evaded
- Monojet + missing ET ??

# Key Aspects of the Model

- Extra fermions are chiral under  $U(1)'$ , and vectorlike under the SM gauge group : this is the consequence of gauge anomaly cancellation (**27 rep. of  $E_6$  group**)
- $U(1)'$ -breaking scalar produces a new singlet-like scalar  $h_\phi \sim 750$  GeV scalar boson
- Decay channels of 750 GeV are determined by gauge symmetry of the underlying Type-II 2HDM with  $U(1)'$  Higgs gauge symmetry (hh, Hh, HH,  $Z'Z'$ , DM DM etc.)

# Conclusion

- Type II 2HDM + U(1) Higgs gauge symmetry : leptophobic U(1)' derived from E6
- Can accommodate the 750 GeV diphoton excess at qualitative level. Quantitatively ?? (Work in progress)
- A few more different models within the same ingredients are being studied now : Stay tuned
- A new playground for new gauge models (including DM)

# Flavor dependent $U(1)'$

- One can consider flavor dependent  $U(1)'$ , assuming only the 3rd generation for example feels  $U(1)'$
- Such model in fact was constructed by Yuji Omura, Chaehyun Yu and myself in the context of Top FBA at the Tevatron [ [Origin of nonMFV = flavor dep.  \$U\(1\)'\$](#)  ]
- Can accommodate  $B \rightarrow D^{(*)}$  tau nu anomaly too
- [arXiv:1108.0350](#), [1108.4005](#), [1205.0407](#), [1212.4607](#)

# Dark Higgs shines through 750 GeV Dark Higgs Boson at the LHC

[arXiv:1601.02490](https://arxiv.org/abs/1601.02490), with T. Nomura

# Disclaimer

In this part, “Dark sector” means that it carries dark gauge charges.

Does not mean that it is made of SM singlets.

# Dark Sector Shining through 750GeV Dark Higgs @ LHC

(arXiv:1601.02490 with Takaaki Nomura)

- Raison d'être of (fundamental?) singlet scalar and vector-like fermions ? **Completely singlet particles ?**
- Can we generate  $\phi(750)$  decay width  $\sim 45$  GeV without any conflict with the known constraints ?
- Yes, if  $\phi(750)$  mainly decays into new particles
- Here we consider  $\phi(750)$  decay into dark photons, assuming  $\phi(750)$  is a dark Higgs boson

## SM+U(1)<sub>X</sub> + New fermions and scalars with U(1)<sub>X</sub> charge

- ❖ New fermions are VL under SM but chiral under U(1)<sub>X</sub>
  - ❖ Relevant couplings are related to new gauge coupling  $g_X$
  - ❖ 750 GeV scalar can decay into new massive gauge boson (Z')
  - ❖ DM candidate is contained in a model
- 
- Every  $f_R$  in the SM has its dark partner,  $F_L$  with the same SM quantum #'s and dark gauge charge
  - $\overline{F_L} f_R X$  : gauge invariant, due to a new complex scalar  $X$  which can make DM candidate, if  $\langle X \rangle = 0$

# Model : Local $U(1)_X$ model with exotic particles

# DM Stability/Longevity

- Accidental  $Z_2$  symmetry after  $U(1)_X$  symmetry breaking
- $(F_L, F_R, X)$ :  $Z_2$ -odd, whereas the rest fields are  $Z_2$ -even
- Have to be careful about operators that break this  $Z_2$  symmetry, making  $X$  decay at (non)renormalizable level
- $X^\dagger \Phi^n$  : gauge invariant operator that has to be forbidden
- $a/(a+b)=n$  for gauge invariance : suitable choice of  $a, b$  can make  $a/(a+b)$  non-integer (absolutely stable), or make  $n$  very large (long-lived  $X$ ). **We choose  $a \sim b \sim 1$  for simplicity**

# Gauge Symmetry breaking and Z'

## ❖ VEVs of scalar fields

$$\langle H \rangle = \frac{1}{\sqrt{2}} v, \quad \langle \Phi \rangle = \frac{1}{\sqrt{2}} v_\phi$$

$$v \approx \sqrt{\frac{-\mu^2}{\lambda}}, \quad v_\phi \approx \sqrt{\frac{-\mu_\Phi^2}{\lambda_\Phi}} \quad (\lambda_{H\Phi} \ll 1)$$

$U(1)_X$  is broken by  $\langle \Phi \rangle$

➔ Massive Z'

We assume H- $\Phi$  mixing is negligible

$$\Phi = (v_\phi + \phi + iG_X) / \sqrt{2}$$

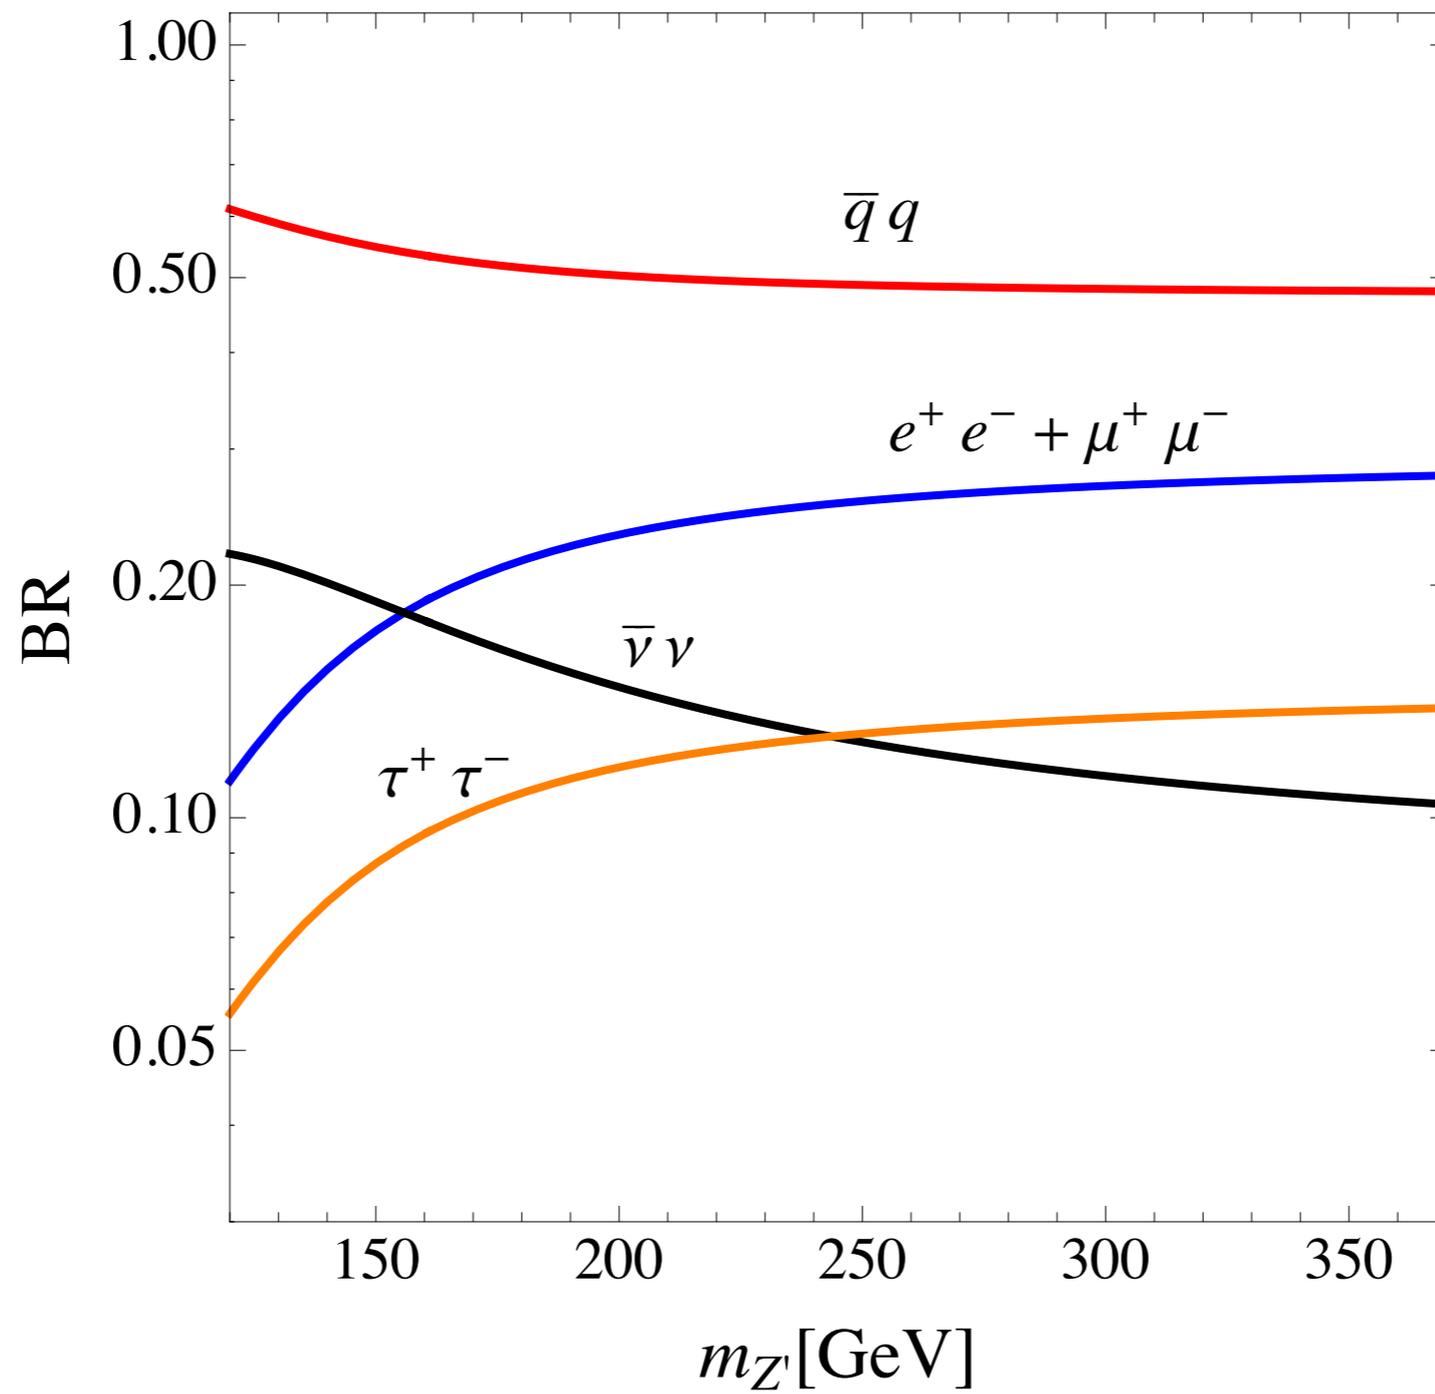

## ❖ Masses of Z' and new fermions

$$m_{Z'}^2 \approx (a+b)^2 g_X^2 v_\phi^2, \quad m_F = \frac{y^F}{\sqrt{2}} v_\phi$$

$$\left\{ \begin{array}{l} y^F = \frac{\sqrt{2}(a+b)g_X m_F}{m_{Z'}} \\ \lambda_\Phi = \frac{2m_\phi^2 g_X^2}{m_{Z'}^2} \end{array} \right.$$

## ❖ Z' decays through small Z-Z' mixing

# BRs of $Z'$

# Gluon fusion and decay modes of $\phi$

*Gluon fusion and diphoton decay of  $\phi$  via new fermion loop*

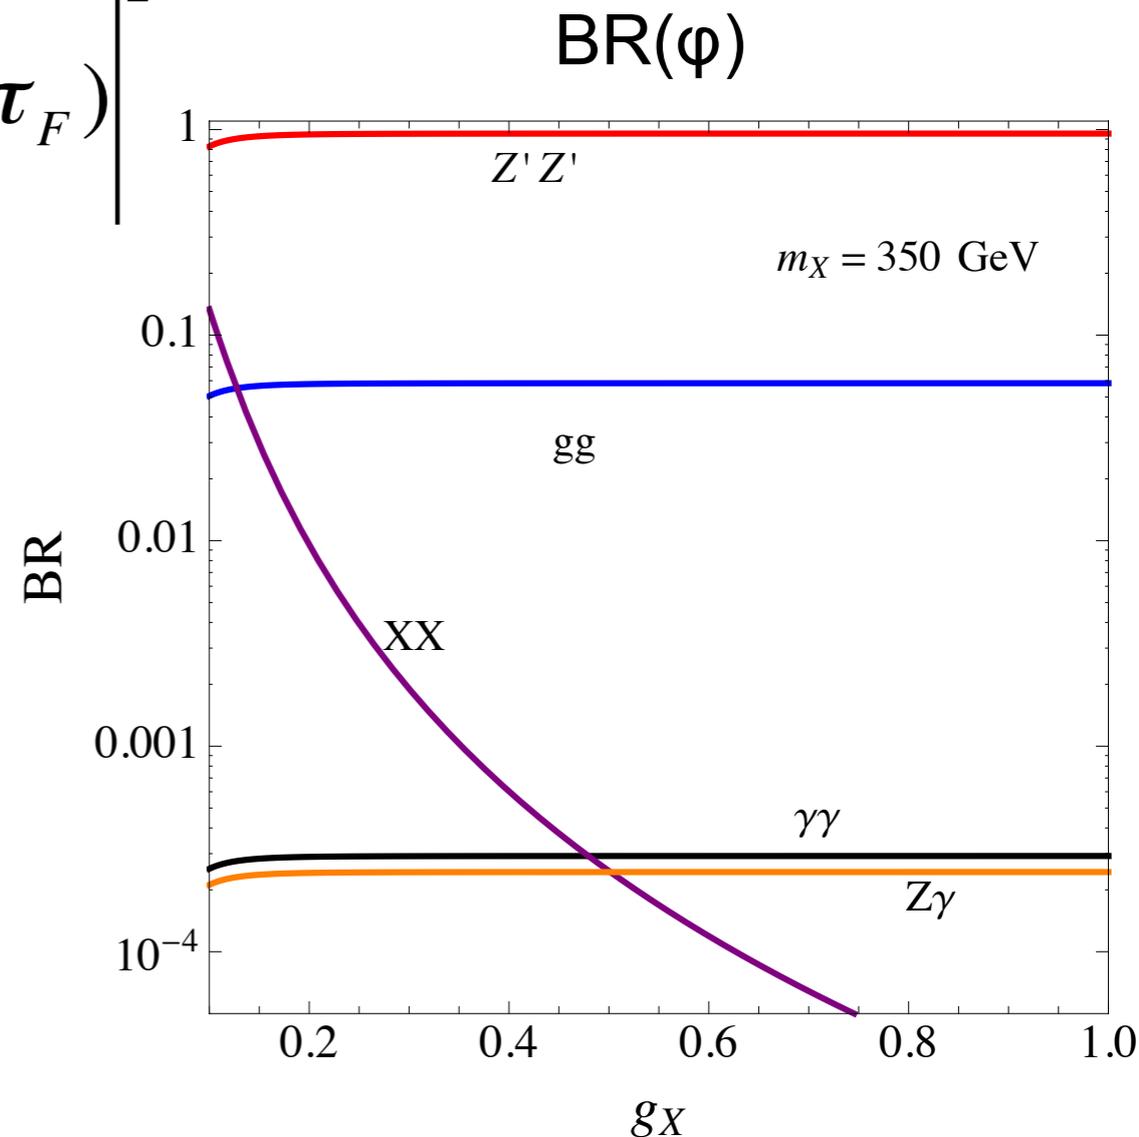

$$gg \rightarrow \phi \quad L_{\phi gg} = \frac{\alpha_s}{8\pi} \left( \sum_{F=U,D} \frac{(a+b)\sqrt{2}g_X}{m_{Z'}} A_{1/2}(\tau_F) \right) \phi G^{a\mu\nu} G_{\mu\nu}^a$$

Decay widths

$$\Gamma(\phi \rightarrow \gamma\gamma) = \frac{\alpha^2 m_\phi^3}{256\pi^3} \left| \sum_F N_c^F \frac{(a+b)g_X Q_F^2}{m_{Z'}} A_{1/2}(\tau_F) \right|^2$$

$$\Gamma(\phi \rightarrow Z'Z') = \frac{(a+b)^2 g_X^2 m_\phi^3}{32\pi m_\phi} \sqrt{1 - \frac{4m_{Z'}^2}{m_\phi^2}} \times \frac{m_\phi^4 - 4m_\phi^2 m_{Z'}^2 + 12m_{Z'}^4}{m_{Z'}^4}$$

# Gluon fusion and decay modes of $\phi$

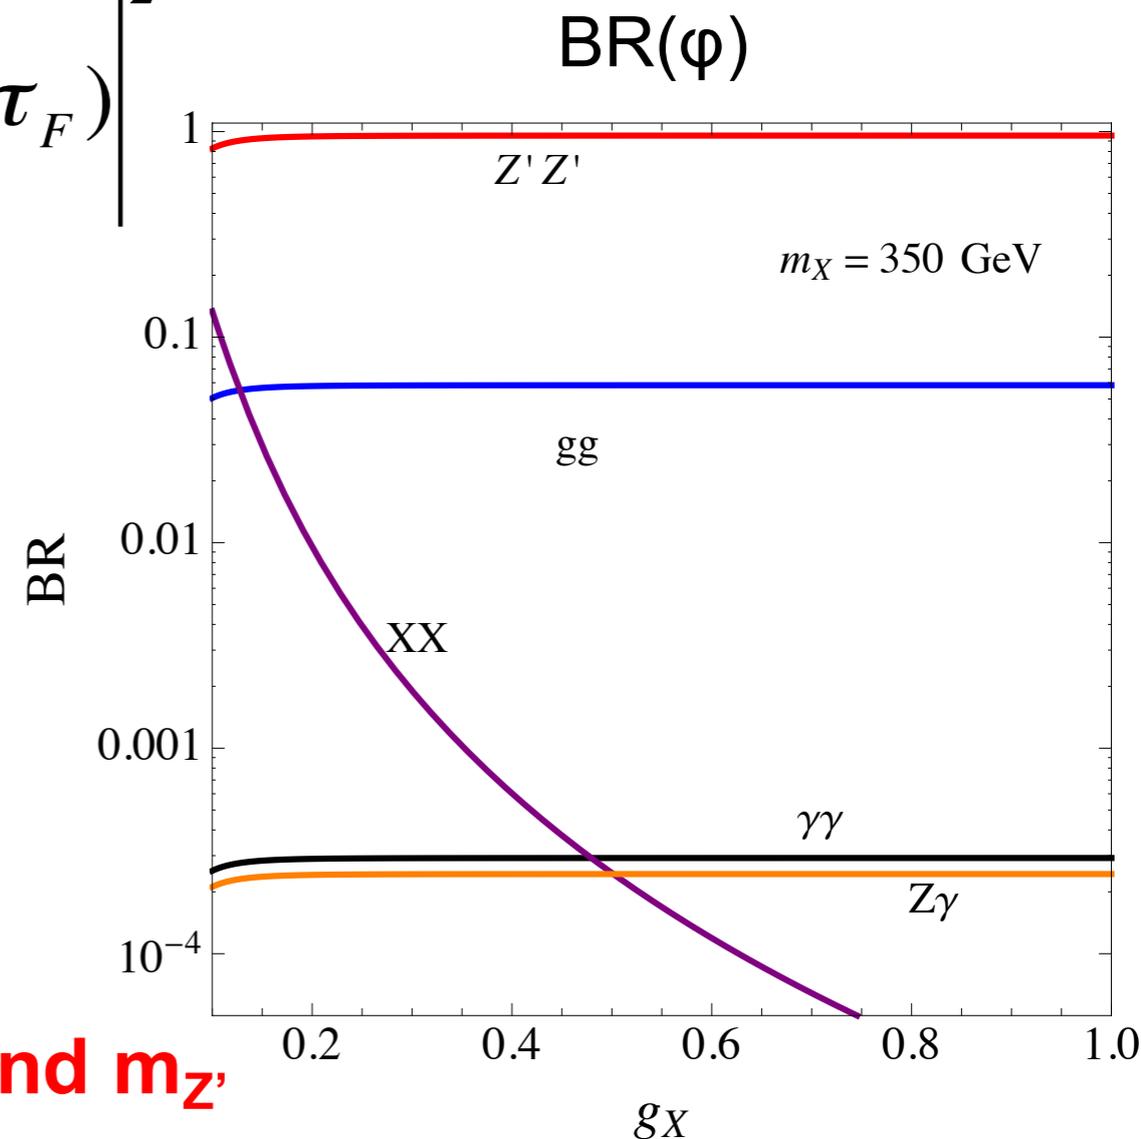

*Gluon fusion and diphoton decay of  $\phi$  via new fermion loop*

$$gg \rightarrow \phi \quad L_{\phi gg} = \frac{\alpha_s}{8\pi} \left( \sum_{F=U,D} \frac{(a+b)\sqrt{2}g_X}{m_{Z'}} A_{1/2}(\tau_F) \right) \phi G^{a\mu\nu} G_{\mu\nu}^a$$

Decay widths

$$\Gamma(\phi \rightarrow \gamma\gamma) = \frac{\alpha^2 m_\phi^3}{256\pi^3} \left| \sum_F N_c^F \frac{(a+b)g_X Q_F^2}{m_{Z'}} A_{1/2}(\tau_F) \right|^2$$

$$\Gamma(\phi \rightarrow Z'Z') = \frac{(a+b)^2 g_X^2 m_\phi^3}{32\pi m_\phi} \sqrt{1 - \frac{4m_{Z'}^2}{m_\phi^2}} \times \frac{m_\phi^4 - 4m_\phi^2 m_{Z'}^2 + 12m_{Z'}^4}{m_{Z'}^4}$$

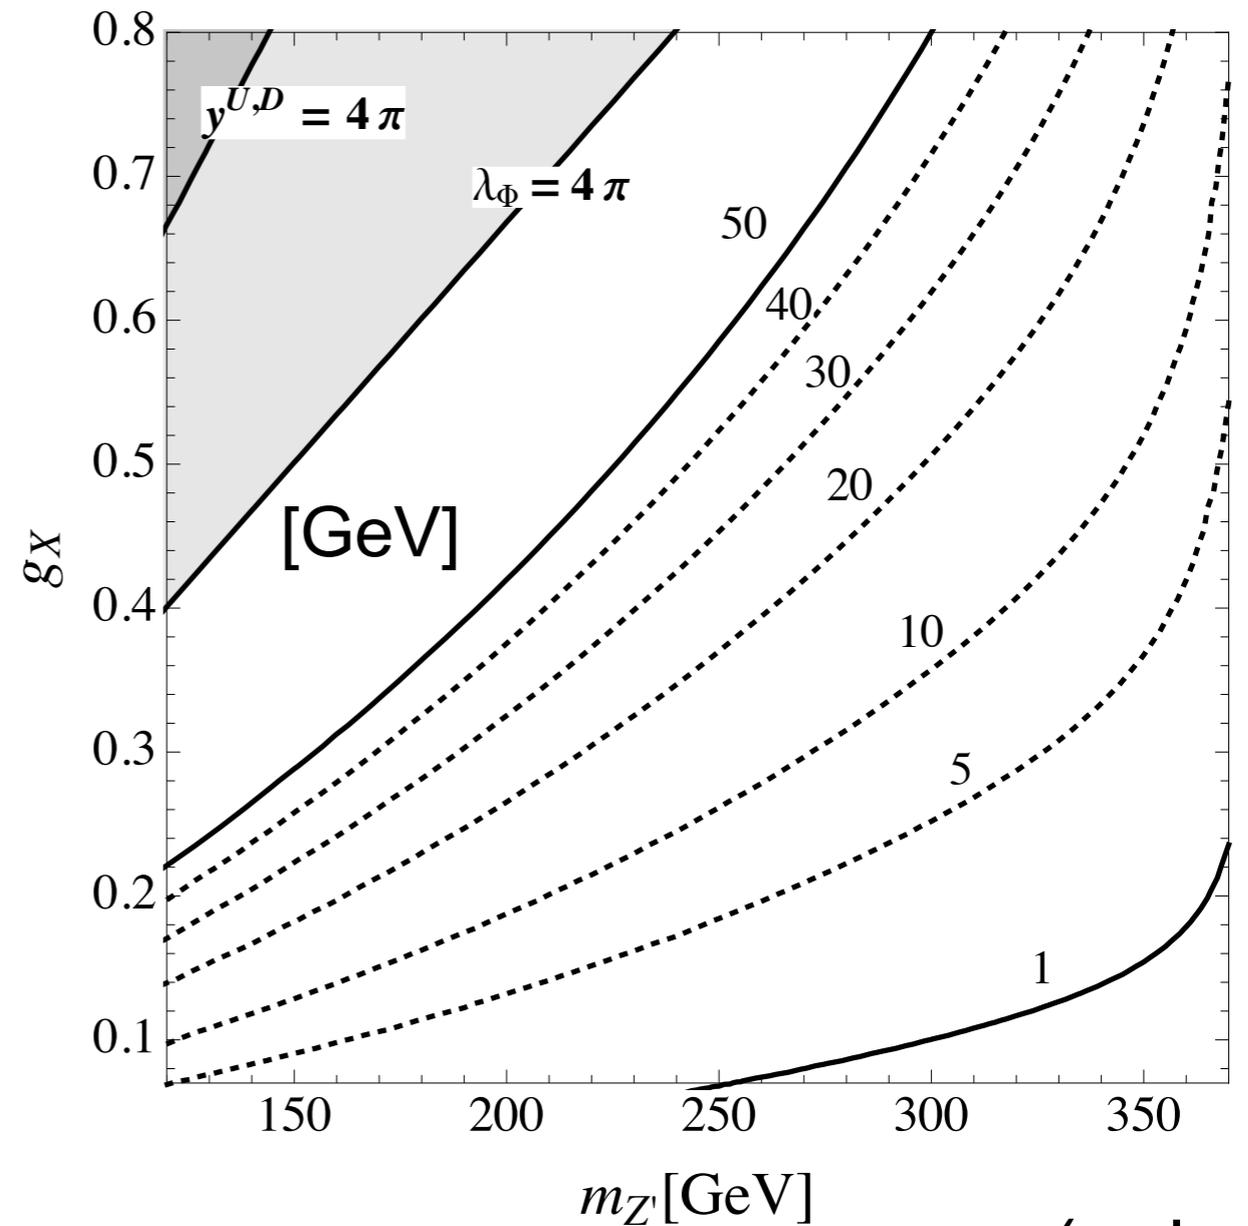

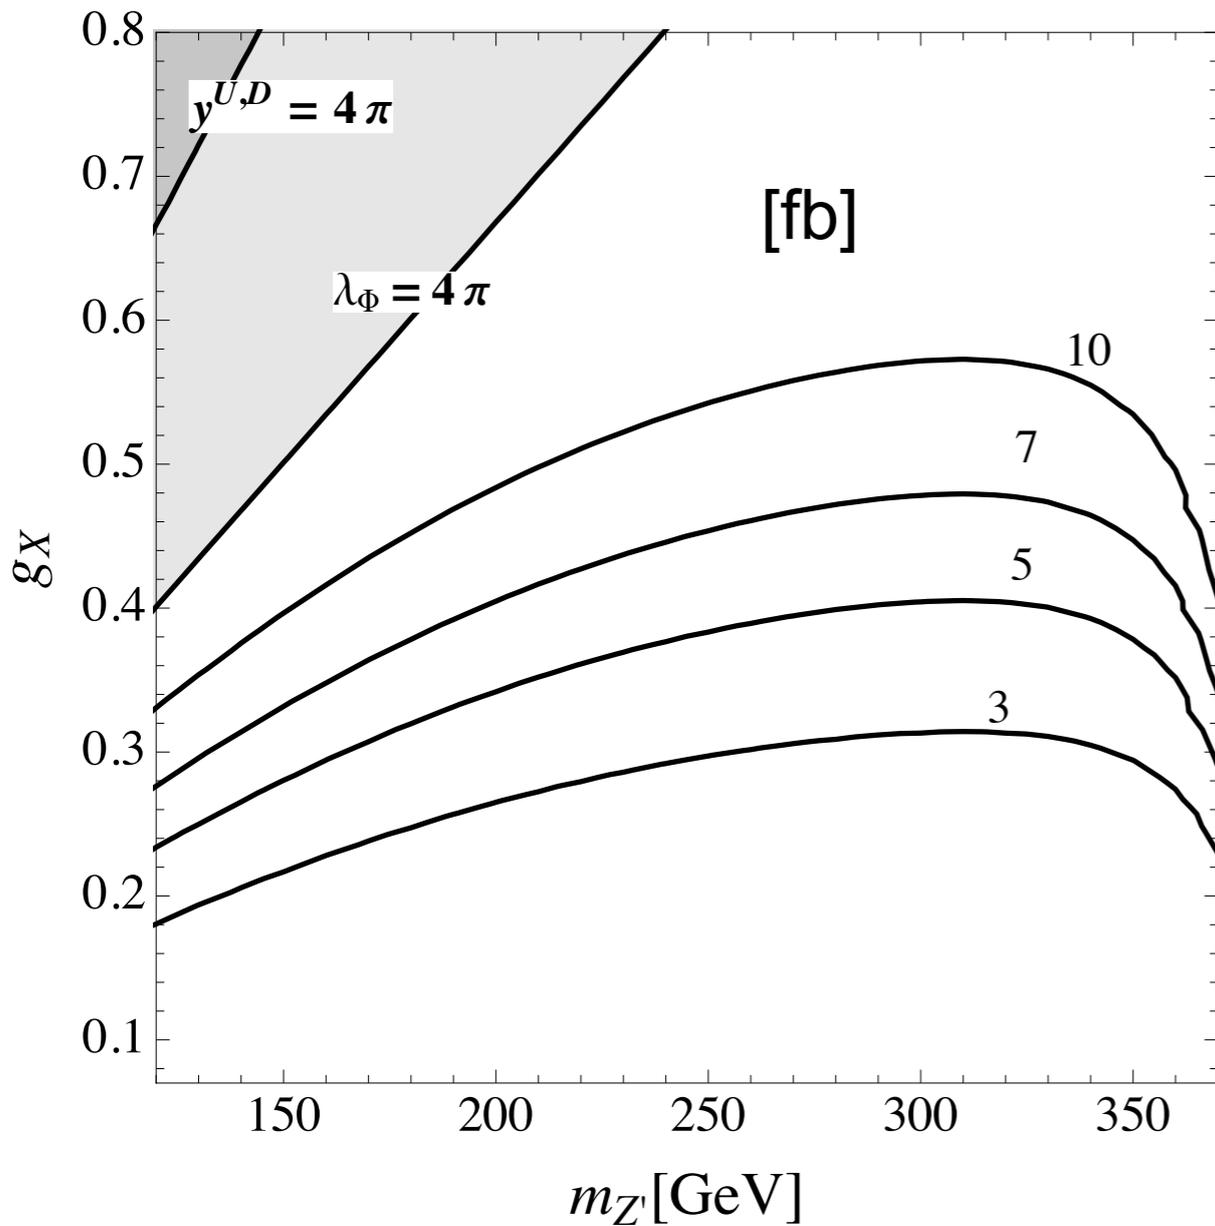

**BRs and gluon fusion are function of  $g_X$  and  $m_{Z'}$**

# Cross section and width of $\phi$

$$\sigma(gg \rightarrow \phi)BR(\phi \rightarrow \gamma\gamma)$$

$$\Gamma_\phi$$

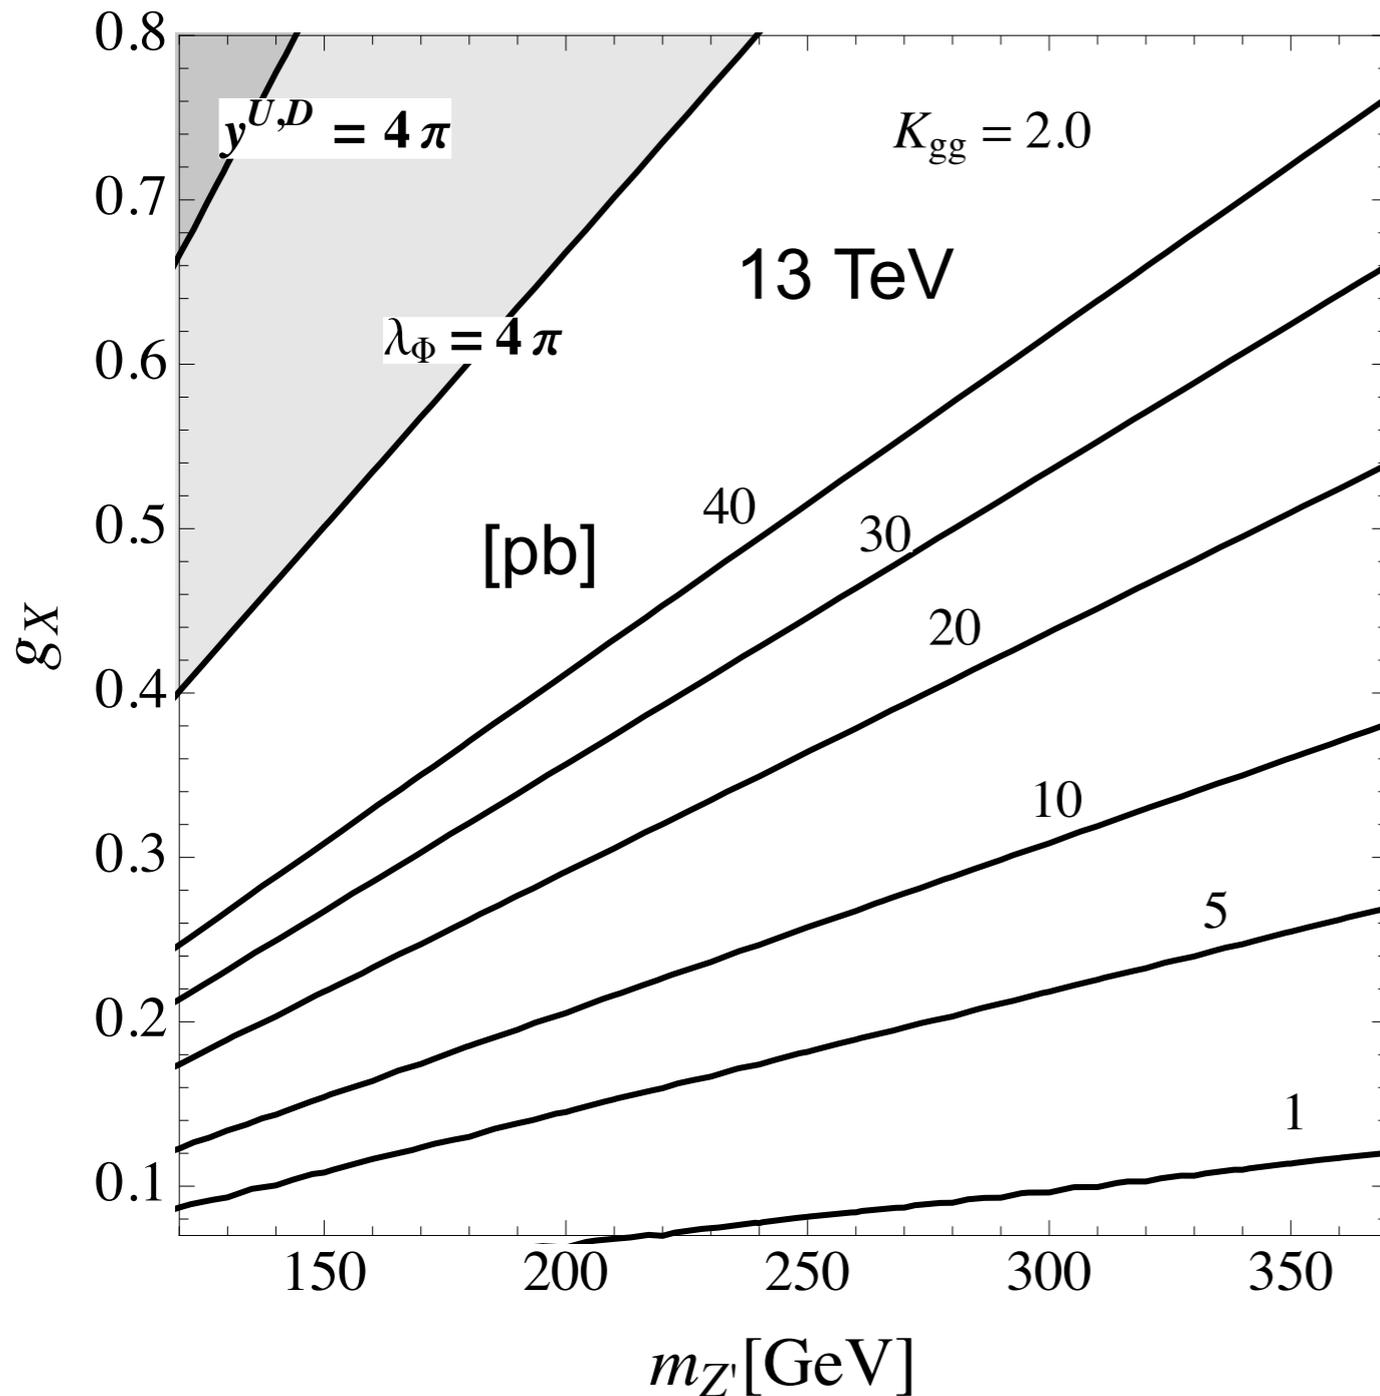

(a~b~1)

$$\{M_{U,D}, M_{E,N}, M_X, \lambda_{X\phi}\} = \{800 \text{ GeV}, 400 \text{ GeV}, 350 \text{ GeV}, 0.075\}$$

- ❖ **~5 fb cross section with  $g_X=0.3\sim 0.5$  and  $m_{Z'}=120\sim 360$  GeV**
- ❖ **Decay width is relatively large:  $O(10\sim 50)$  GeV**

# Discussion: Cross section of $\varphi$ production

- Large cross section of  $O(10)$  pb
- $\sim 1/5$  for 8 TeV case
- No direct constraints for  $pp \rightarrow \varphi \rightarrow Z'Z' \rightarrow 4f_{SM}$
- $Z'$  width is very narrow  $\Gamma/M < 10^{-6}$  due to small  $Z$ - $Z'$  mixing

$$\{M_{U,D}, M_{E,N}, M_\chi, \lambda_{\chi\phi}\} = \{800 \text{ GeV}, 400 \text{ GeV}, 350 \text{ GeV}, 0.075\}$$

( $a \sim b \sim 1$ )

# DM Relic Density

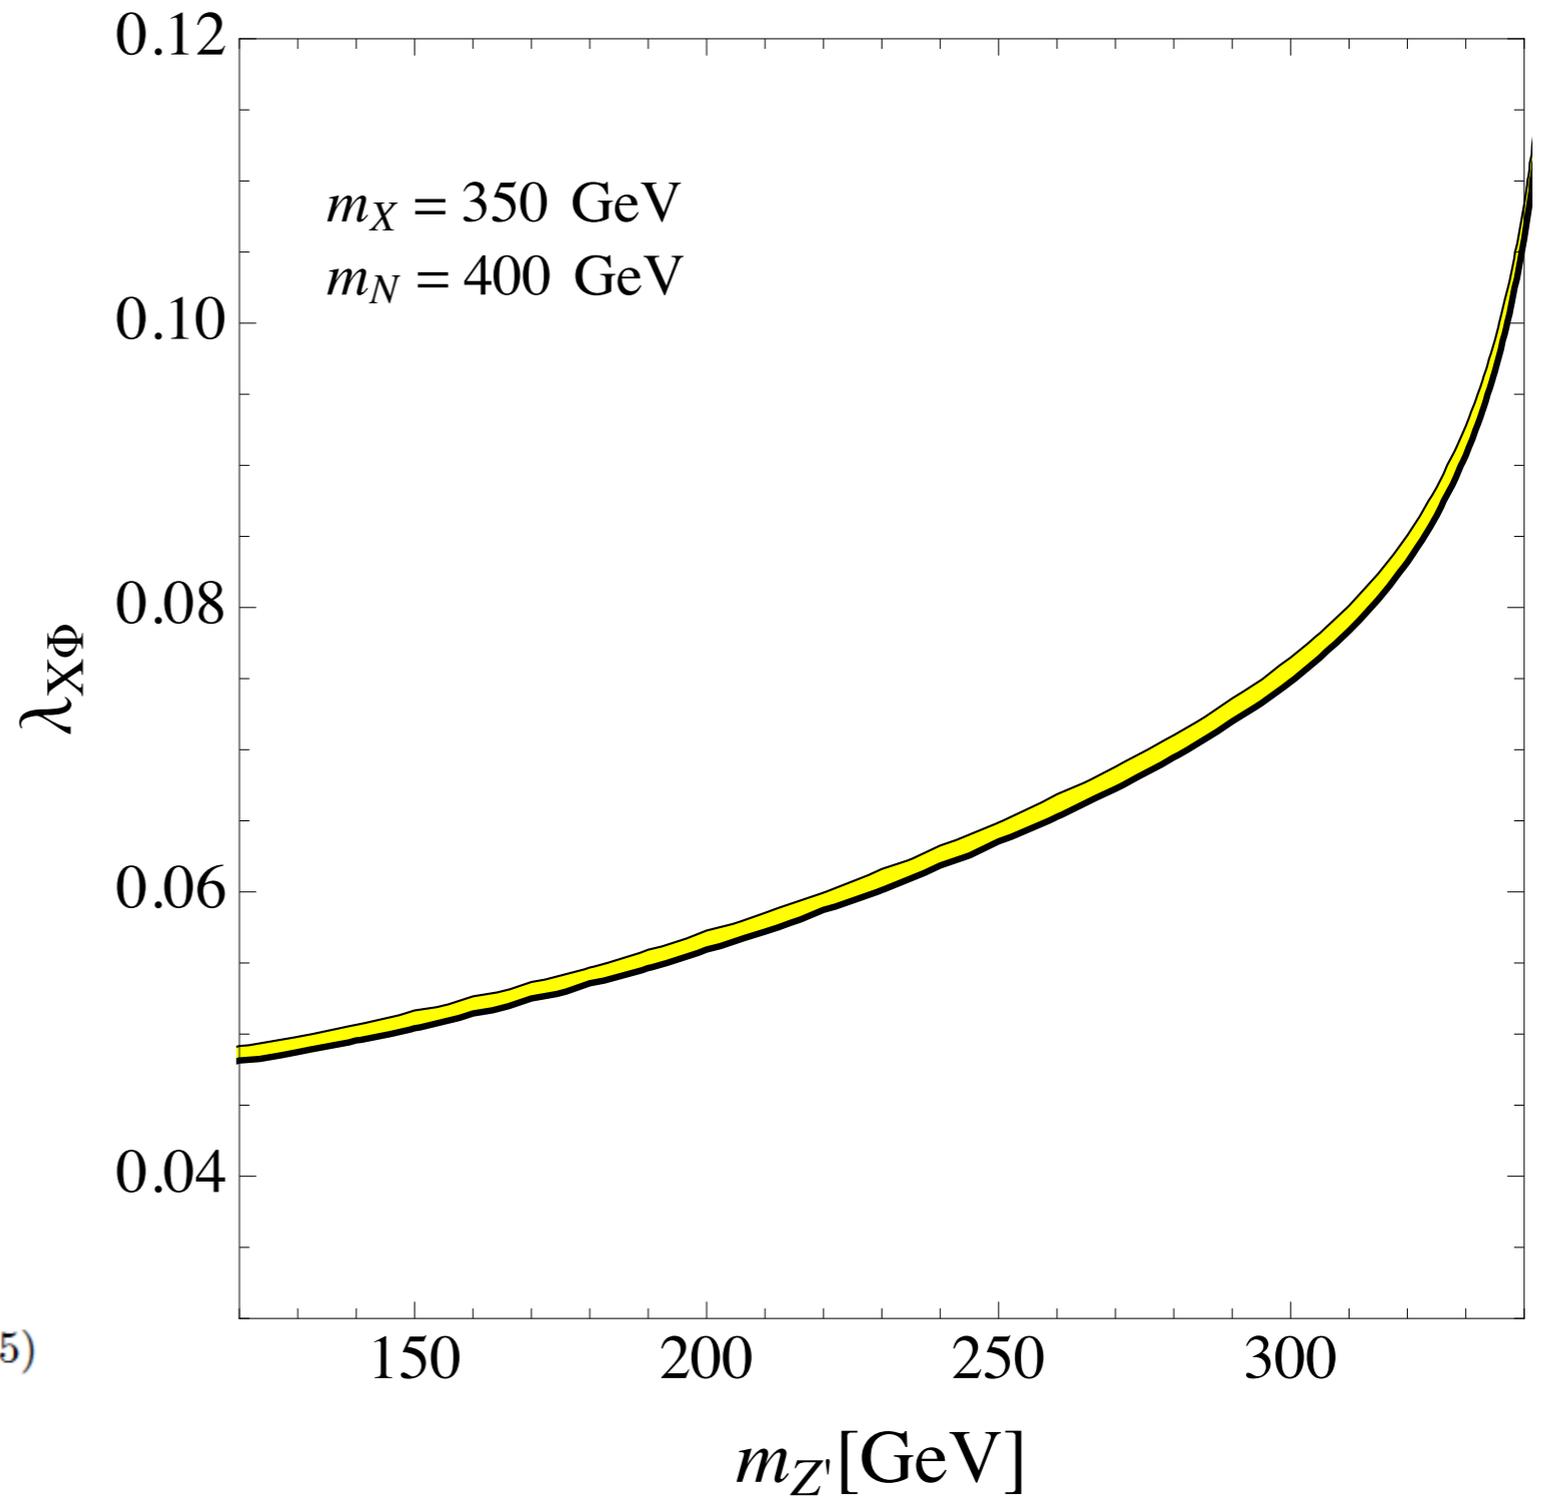

Annihilation process

$$XX \rightarrow Z'Z'$$

$$NN \rightarrow Z'Z'$$

$$\begin{aligned} \langle \sigma v \rangle_{XX^*} &\simeq \frac{\lambda_{X\Phi}^2}{32\pi m_X^2} \frac{m_{Z'}^4}{(4m_X^2 - m_s^2)^2} \\ &\times \frac{4m_X^4 - 4m_X^2 m_{Z'}^2 + 3m_{Z'}^4}{m_{Z'}^4} \sqrt{1 - \frac{m_{Z'}^2}{m_X^2}} \end{aligned} \quad (25)$$

$$\begin{aligned} \langle \sigma v \rangle_{N\bar{N}} &\simeq \frac{g_X^4}{2\pi m_N^2} \frac{m_N^4}{(m_N^2 - m_s^2)^2} \\ &\frac{4m_N^4 - 4m_N^2 m_{Z'}^2 + 3m_{Z'}^4}{m_{Z'}^4} \sqrt{1 - \frac{m_{Z'}^2}{m_N^2}} \end{aligned} \quad (26)$$

N is subdominant in our analysis

# Digress on muon ( $g-2$ )

- For  $m_X = 350$  GeV and  $m_{E_i} = 400$  GeV, we can account for the deficit in the  $a_\mu = 8 \times 10^{-10}$ , if  $y_{E_i\mu} \sim 2 - 3$
- However, in this case, the annihilation cross section for  $X$  is too large, and  $X$  cannot be the main component of the DM in the present universe
- So we don't pursue this possibility any further

# Summary with this new DM model

- A new viable model for DM with rich dark sector
- Interesting in its own, if 750 GeV excess disappears
- Can accommodate a large width with decay into  $Z'Z'$
- Rich collider phenomenology, since dark fermions are charged under the SM gauge charges
- No strong constraints from DM (in)direct detection expt's
- Indirect signatures and  $SU(2)_L$  charged case under study

# Composite Models

Work in progress with  
Chaehyun Yu, T.C. Yuan (Academia Sinica)

# Basic assumptions

- New QCD-like confining gauge force described by  $SU(N_h)$
- New Q's and L's charged under  $SU(N_h)$
- $SU(2)_L$  doublets or singlets
- Q,L : Heavy fermions ( $\gg$  new confining scale)
- Light h-gluonball : decay into SM particles through loop
- 750 GeV excess  $\sim \eta_{aQ}$

# Ex : Doublet with $Q_e=2/3$

$$\sigma(gg \rightarrow \eta_Q \rightarrow \gamma\gamma) = \frac{C_{gg}}{sm_{\eta_Q}\Gamma_{\text{tot}}}\Gamma[\eta_Q \rightarrow gg]\Gamma[\eta_Q \rightarrow \gamma\gamma],$$

$$\Gamma_{\gamma\gamma} = \frac{\alpha^2 N_c N_h e_Q^4}{m_Q^2} |R_{1S}(0)|^2,$$

$$\Gamma_{\gamma Z} = \frac{\alpha^2 N_c N_h e_Q^2 (1 + 4e_Q x_w)^2 (4 - r_Z)}{32m_Q^2 x_w (1 - x_w)} |R_{1S}(0)|^2,$$

$$\Gamma_{ZZ} = \frac{\alpha^2 N_c N_h (1 - r_Z)^{3/2}}{16x_w^2 (1 - x_w)^2 m_Q^2 (2 - r_Z)^2} (1 + 4e_Q x_w + 8e_Q^2 x_w^2)^2 |R_{1S}(0)|^2,$$

$$\Gamma_{WW} = \frac{\alpha^2 N_c N_h (1 - r_W)^{3/2}}{8x_w^2 m_Q^2 (2 - r_W)^2} |R_{1S}(0)|^2,$$

$$\Gamma_{gg} = \frac{C_F N_h \alpha_s^2}{2m_Q^2} |R_{1S}(0)|^2,$$

$$\Gamma_{ghgh} = \frac{C_h N_c \alpha_h^2}{2m_Q^2} |R_{1S}(0)|^2,$$

$$|R_{1S}(0)|^2 = m_Q \left\langle \frac{dV}{dr} \right\rangle = 4 \left( C_h \alpha_h \frac{m_Q}{2} \right)^3$$

gh's will hadronize into a h-gleball, eventually decays into SM particles through loop diagrams (in progress)

In the numerical analysis, we use

$$|R_{1S}(0)|^2 = m_Q \left\langle \frac{dV}{dr} \right\rangle = 4 \left( C_h \alpha_h \frac{m_Q}{2} \right)^3$$

$$N_c = 3,$$

$$N_h = 3, 4, 5,$$

$$m_{\eta_Q} = 750 \text{ GeV},$$

$$m_Q = 375 \text{ GeV},$$

$$\alpha = \frac{1}{128},$$

$$\alpha_s = 0.12,$$

$$e_Q = \frac{2}{3}.$$

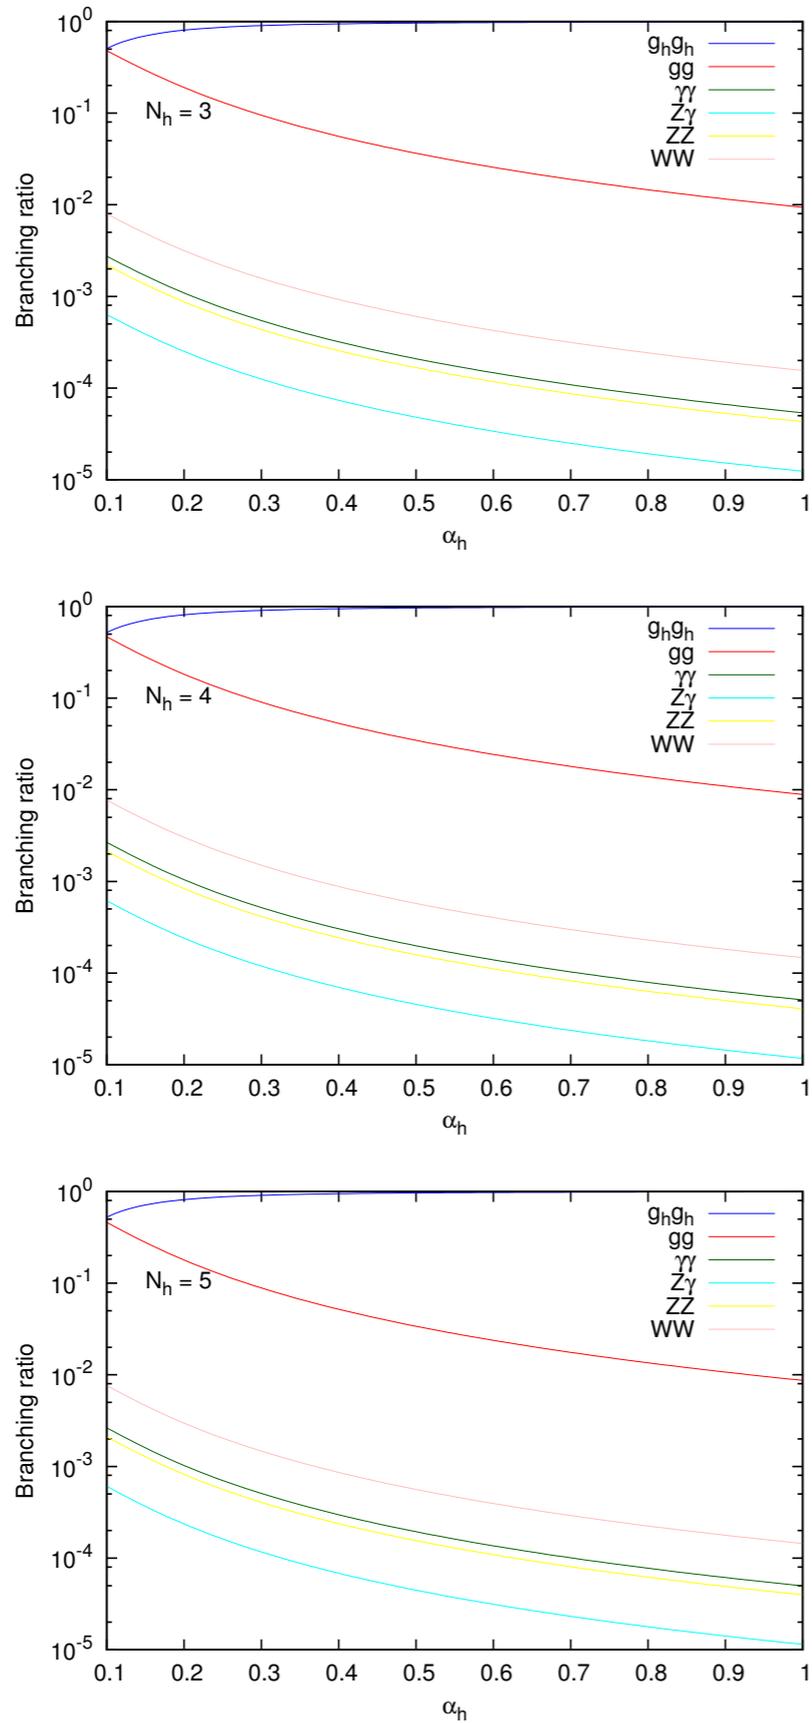

FIG. 1. Branching ratios of  $\eta_Q$  decays as a function of  $\alpha_h$  for  $N_h = 3, 4,$  and  $5,$  respectively.

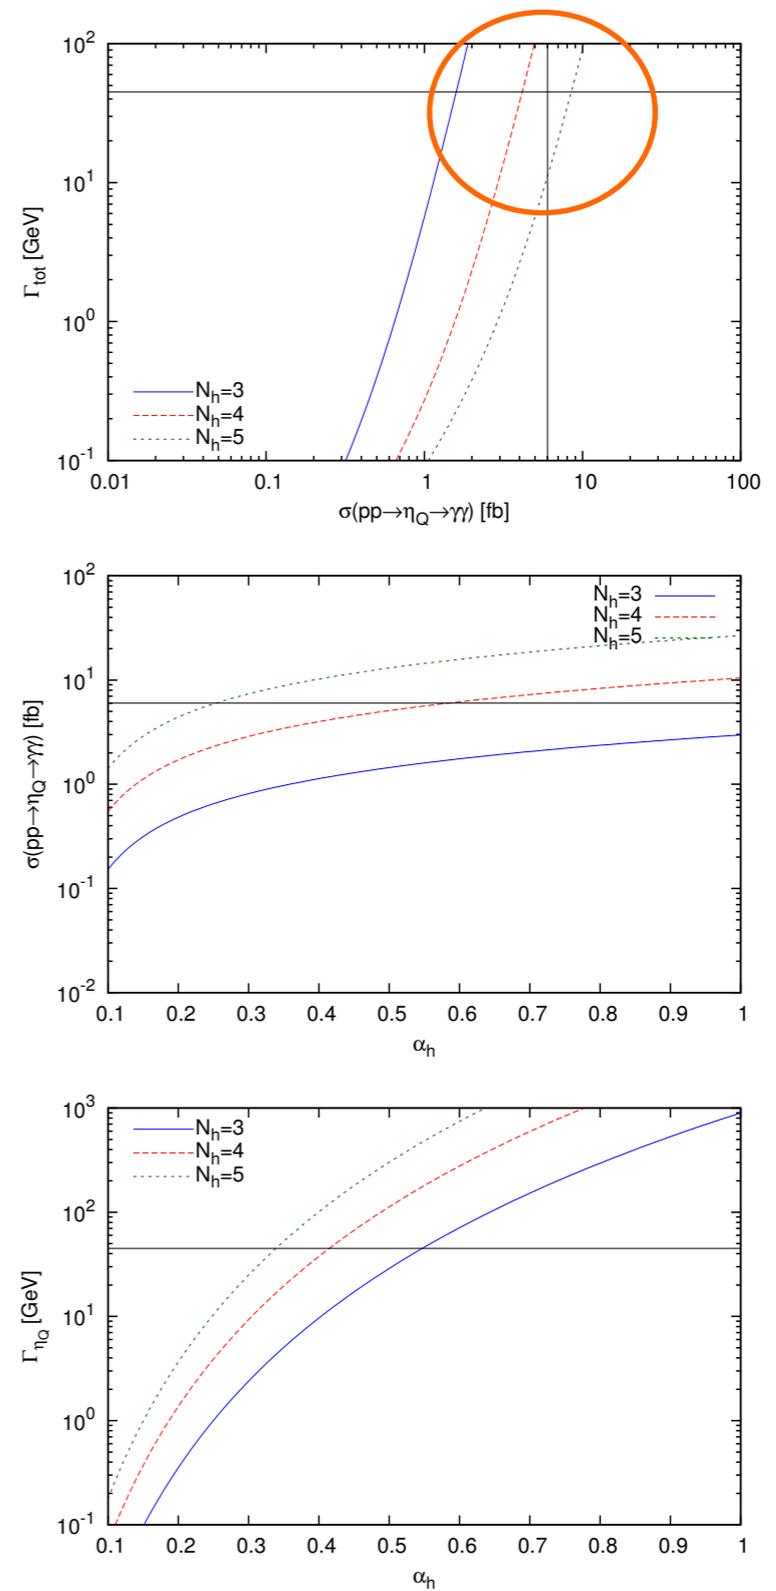

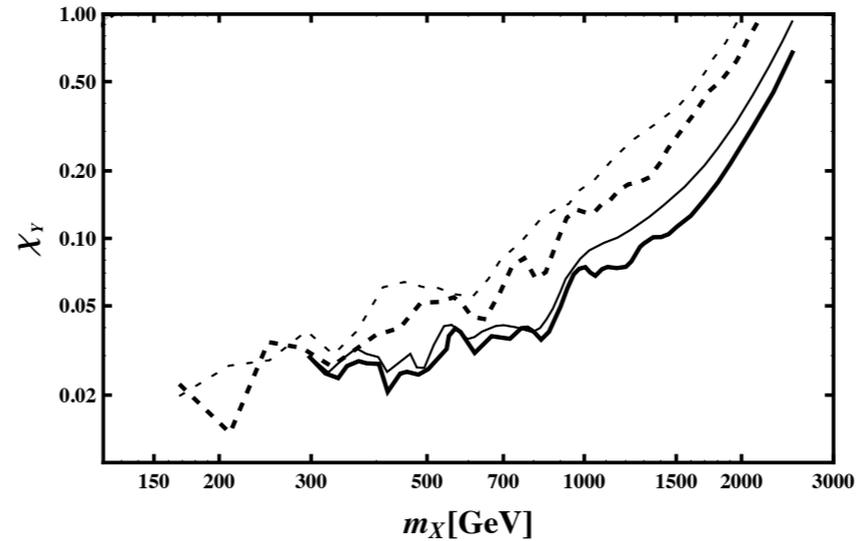

FIG. 2. (a) The cross section for  $pp \rightarrow \eta_Q \rightarrow \gamma\gamma$  at  $\sqrt{s} = 13$  TeV in unit of fb VS  $\Gamma_{\text{tot}}$  in unit of GeV. (b) The cross section in unit of fb as a function of  $\alpha_h$ , and (c)  $\Gamma_{\text{tot}}$  in unit of GeV as a function of  $\alpha_h$ .

# Closing Remarks

- Diphoton excess needs to be confirmed this/next year
- If confirmed, this may be a signal of new gauge force and its Higgs
- The width of the resonance is a crucial information for particle physics model buildings
- Not easy to have  $\sim 45$  GeV width without conflict with the present constraints on other decay channels
- The easiest way is to allow new decay channels which are less constrained

Backup

# Constraints on dark photon

Jaeckel and Spannowsky,  
arXiv:1212.3620 [hep-ph]

Figure 1: 95% exclusion limits on the kinetic mixing parameter  $\chi_Y$  from the ATLAS (dashed) and CMS (solid)  $Z'$  searches. The thin lines correspond to the  $\mu^+\mu^-$  channel only, while the thick lines result from a combination of the  $\mu^+\mu^-$  and  $e^+e^-$  channels.

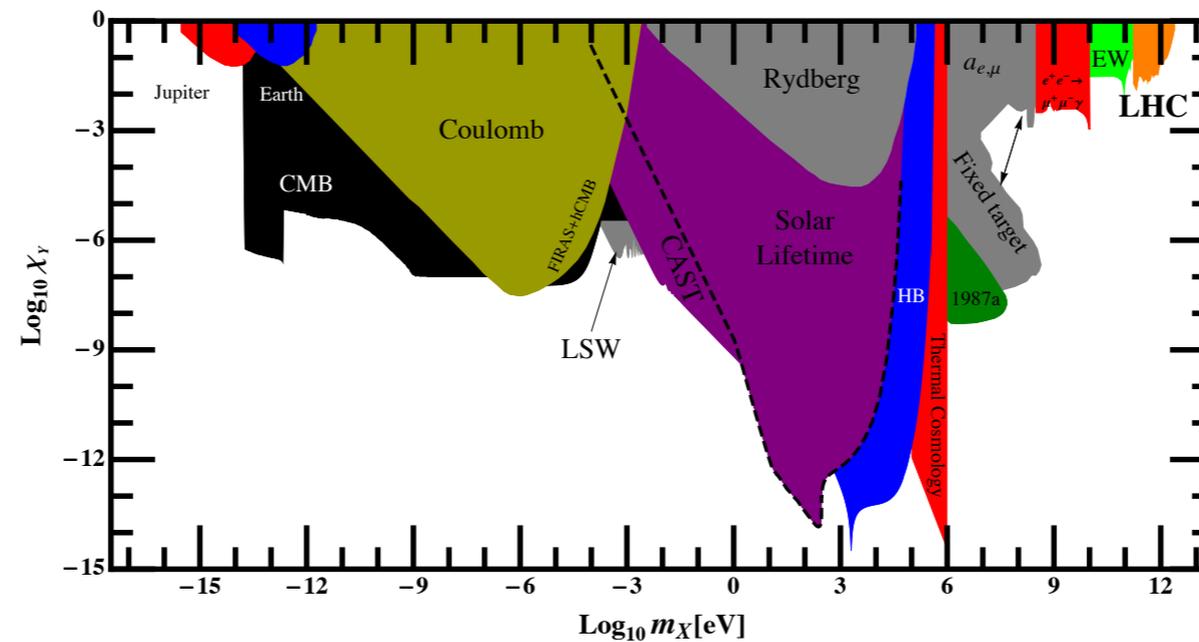

Figure 2: Combination of the new LHC limits with a range of other constraints on hidden photons (see refs. [19, 20] for details). The new “LHC” region is marked in orange and extends the existing bounds to a previously uncovered range of high masses. Note that the limits are with respect to the hypercharge mixing parameter  $\chi_Y$ . For small hidden photon masses the kinetic mixing parameter with the ordinary photon is related to  $\chi_Y$  through  $\chi = \cos(\theta_W)\chi_Y$ .
